

# New Zone of High-Grade mineralisation extends strike 50% to 3.1 kilometres at Challenger's Hualilan Gold Project

## **Highlights**

- New zone of high-grade mineralisation extends strike extent of Hualilan by one kilometre from 2.1 kilometres to 3.1 kilometres - an increase of circa 50%.
- Mineralisation encountered 550 metres south of the previous southernmost drill intercepts at Hualilan. Underground rock saw channel sampling results from this new zone include:
  - 13.0m at 15.5 g/t AuEq<sup>2</sup> 12.0 g/t Au, 80.2 g/t Ag, 5.7 % Zn, including
  - 8.5m at 21.9 g/t AuEq<sup>2</sup> 17.8 g/t Au, 113.7 g/t Ag, 6.2% Zn (Flor de Hualilan Adit); and
  - 9.2m at 5.1 g/t AuEq<sup>2</sup> 3.0 g/t Au, 89.6 g/t Ag, 2.2% Zn (Flor de Hualilan Adit); and
  - **3.8**m at 14.6 g/t AuEq<sup>2</sup> 3.8 g/t Au, 155.8 g/t Ag, 20.2% Zn (Flor de Hualilan Adit)
  - This new zone of mineralisation is mapped extending in outcrop approximately 500 metres further south and 400 metres up-dip from the location of the high-grade channel samples.
- The completion of the extended program of sampling all adits south of the Magnata fault builds the case for a significant continuous zone of high-grade mineralisation from Magnata to Sentazon. Results include:
  - 9.0m at 26.7 g/t AuEq<sup>2</sup> 26.1 g/t Au, 50.8 g/t Ag, 0.1% Zn including;
  - 6.9m at 34.0 g/t AuEq2 33.1 g/t Au, 60.9 g/t Ag, 0.1 % Zn (Labor 5 tunnel), and
  - 10.5m at 14.0 g/t AuEq<sup>2</sup> 11.2 g/t Au, 215.3 g/t Ag, 1.0% Zn including;
  - 6.8m at 21.3 g/t AuEq<sup>2</sup> 17.0 g/t Au, 328.7 g/t Ag, 1.5 % Zn (Labor 6 tunnel) and;
  - 30.7m at 7.7 g/t AuEq<sup>2</sup> 0.9 g/t Au, 70.2 g/t Ag, 13.5% Zn (Sentazon Adit) and;
  - 52.0m at 3.4 g/t AuEq<sup>2</sup> 1.3 g/t Au, 7.9 g/t Ag, 4.5% Zn (Sentazon Adit).
- Results confirm that the historical selective channel sampling missed much broader zones of near surface mineralisation surrounding the high-grade mineralisation.

## Commenting on the results, CEL Managing Director, Mr Kris Knauer, said

"We are progressively unveiling the scale that we have anticipated at our flagship Hualilan Gold Project. The current set of results are outstanding, extending the size of the mineralised envelope at Hualilan by one kilometre from 2.1 to 3.1 kilometres, with mineralisation remaining open in all directions.

It appears that the high-grade mineralisation extends over this entire 3.1 kilometers of strike, and, when coupled with the completed sampling of all underground workings at Cerro Sur, supports a view of one continuous zone of high-grade mineralisation from Magnata to Sentazon."

Challenger Exploration Limited ACN 123 591 382 ASX: CEL **Issued Capital** 808.7m shares 86.6m options 120m perf shares 16m perf rights Australian Registered Office Level 1 1205 Hay Street West Perth WA 6005 **Directors** Mr Kris Knauer, MD and CEO Mr Scott Funston, Finance Director Mr Fletcher Quinn, Chairman

**Challenger Exploration (ASX: CEL) (CEL** the **Company)** is pleased to announce results from the ongoing rock saw channel sampling program at the Company's flagship Hualilan Gold project in San Juan province, Argentina.

The sampling was undertaken using a rock saw to cut and recover a continuous channel measuring approximately 40cm x 40cm, with sample weight averaging 4.8 kg per metre. Samples were logged, and submitted for assay with QAQC samples (blanks and standards) using the same procedure as drill core. The channel sample is analogous to a drill core sample, and it is expected that the data can be incorporated into a resource estimation in the same way as drilling results.

In light of the recent results from this program, notably the broader zones of mineralisation which appear to have been missed by the selective historical sampling, the program was extended to include channel sampling of all underground workings and exploration adits throughout the project including those located outside of the footprint of the known mineralisation.

The current results are from underground channel sampling at Cerro Sur and include results from the Flor de Hualilan exploration drive which is located 550 metres south of CEL drill hole GNRC-052 (6m at 1.7 g/t gold, 4.4 g/t silver, 0.3% zinc), the southernmost drill hole at Hualilan to intersect mineralisation. This is the first time a systematic program of sampling has been conducted in many of the underground tunnels and the first time the Flor de Hualilan workings have been sampled.

Sampling of the Flor de Hualilan Adit, which is believed to date from the 1800s, returned a number of high-grade intercepts with six of the eight channels returning high-grade mineralisation including **13.0m at 15.5 g/t AuEq, 9.2m at 5.1 g/t AuEq** including **4.6m at 9.5 g/t AuEq**, and **3.8m at 14.6 g/t AuEq**. The mineralisation is open to the south, north, up-dip and down-dip and several channels ended in mineralisation. FDH-10-02 (down-dip) ended in **10.2 g/t AuEq**, FDH-10-06 (up-dip) ended in **42 g/t AuEq**, and the most southerly samples in the Flor de Hualilan adit recorded **12.1 g/t AuEq** and **23.0 g/t AuEq**. These high-grade results and broad zones of mineralisation in the channel sampling in the Flor de Hualilan Adit was not expected by the Company as the gold is not visible.

In addition to these results, which extend the known mineralisation 550 metres south, historical mapping which was previously discounted, indicates sulphide mineralisation outcropping over approximately 500 metres strike south of the Flor de Hualilan Adit. Reconnaissance by the Company has confirmed what appears to be weathered skarn mineralisation at surface well south of the Flor de Hualilan Adit. This extends the potential strike extent of the high grade skarn mineralisation by approximately 50% from 2.1 to 3.1 kilometres.

The balance of the results are from channel sampling of the various adits and drives between Magnata and Sentazon at Cerro Sur. The sampling returned a number of high-grade results including **9.0m at 26.7 g/t AuEq, 10.5m at 14.0 g/t AuEq**, and **5.2m at 10.7 g/t AuEq**. This supports the likelihood of a continuous zone of high-grade mineralisation over at least 600 metres from Magnata in the north to Sentazon in the south. Additionally, the sampling returned a number of wide zones of mineralisation including **30.7m at 7.7 g/t AuEq** and **52.0m at 3.4 g/t AuEq** confirming the presence of broad zones of remnant lower grade mineralisation surrounding the higher-grade mineralisation.

## **DISCUSSION OF RESULTS**

## **Channel Sampling Program**

The channel sampling program has been designed to allow the inclusion of the component of the historical high-grade mineralisation which is up-dip of the Company's drilling in a resource estimate that can be reported according to JORC. This includes the majority of the mineralisation within 40 vertical metres of surface and the extensions of mineralisation up into the hills at Cerro Norte and Cerro Sur. In the historical foreign (non JORC compliant) resource estimation, this mineralisation was included based on the results of underground mapping and selective channel sampling. Importantly, this near surface component of the mineralisation generally exhibits high-grades.

## Flor De Hualilan Adit

The Flor de Hualilan adit, like the majority of the old workings, is believed to date back to at least the late 1800s. It is located at the southern end of the Hualilan Gold Project approximately 550 metres south of GNRC-052 (6m at 1.7 g/t gold, 4.4 g/t silver, 0.3% zinc), the southernmost drill hole at Hualilan to intersect mineralisation. The Company has now drilled GNDD-251 (assays pending) up-dip of GNRC-052 and GNDD-247 and GNDD-256 (both assays pending) a further 50 metres south along strike from GNRC-052.

Prior to this sampling conducted by CEL, the Flor de Hualilan workings had not been sampled. In light of the recent results from this program, notably the broader zones of mineralisation which appear to have been missed by the selective historical sampling, the underground channel sampling program was extended to include all underground workings and exploration adits including those located outside of the footprint of the known mineralisation such as the Flor de Hualilan workings.

## Table 1 - Flor de Hualilan channel significant channel sampling results

(See Table 3 for information regarding AuEq's reported under the JORC Code)

As listed in Table 1, the Flor de Hualilan channel sampling program returned a number of high-grade results including 13.0 metres at 15.5 g/t AuEq (12.0 g/t gold, 80.2 g/t silver, 5.7 % zinc, 4.8% lead) including 8.5 metres at 21.9 g/t AuEq (17.8 g/t gold, 113.7 g/t silver, 6.2% zinc, 6.9 % lead) and 3.8 metres at 14.6 g/t AuEq (3.8 g/t gold, 155.8 g/t silver, 20.2% zinc, 4.2% lead). In addition to high gold

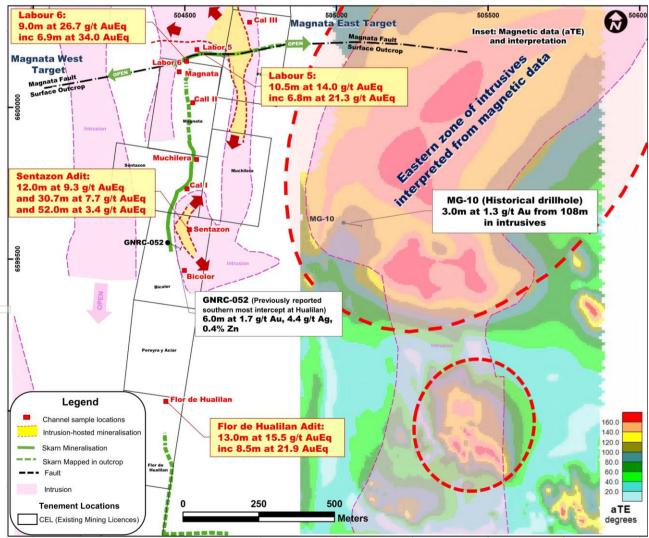

Challenger Exploration Limited ACN 123 591 382 ASX: CEL **Issued Capital** 808.7m shares 86.6m options 120m perf shares 16m perf rights Australian Registered Office Level 1

1205 Hay Street West Perth WA 6005 **Directors** Mr Kris Knauer, MD and CEO Mr Scott Funston, Finance Director Mr Fletcher Quinn, Chairman

and silver grades, with individual splits including **35.6 g/t gold + 165 g/t silver**, **36.5 g/t gold + 90.9 g/t silver** and **16.2 g/t gold + 529 g/t silver**, the Flor de Hualilan mineralisation contains significant lead and copper which have not been included in the calculation of gold equivalent values. The Company's metallurgical testing, however, has indicated a potential pathway to recover the copper and lead credits.

The results extend the known high-grade skarn mineralisation a further 550 metres south of the southernmost drill intersection. Additionally, historical mapping, which was previously discounted by the Company, indicates sulphide mineralisation in outcrop over an additional 500 metres of strike south of the Flor de Hualilan Adit. Reconnaissance field mapping by the Company has now confirmed what appears to be weathered skarn mineralisation at surface well south of the Flor de Hualilan Adit. This has the potential to extend the strike extent of the high-grade skarn mineralisation by approximately 50% from 2.1 kilometers to 3.1 kilometers.

Challenger Exploration Limited ACN 123 591 382 ASX: CEL

**Issued Capital** 808.7m shares 86.6m options 120m perf shares 16m perf rights

Australian Registered Office Level 1 1205 Hay Street West Perth WA 6005 **Directors** Mr Kris Knauer, MD and CEO Mr Scott Funston, Finance Director Mr Fletcher Quinn, Chairman

The Company also notes the same historical surface mapping indicates, not only mineralisation in outcrop over 400 metres along strike south of Flor de Hualilan, but also 400 metres up dip. This opens significant potential for additional high-grade mineralisation to the south. In this additional one kilometre of strike south of recent CEL drillholes GNDD-247 and GNDD256 (both assays pending), now confirmed as potentially containing high-grade skarn mineralisation, there are only three historical drill holes all of which are believed to have been not optimally targeted. Several new holes are programmed to test this previously unrecognised zone of mineralisation in the south.

## Magnata to Sentazon

All of the adits and old workings covering the 600 metres of strike between the Magnata Fault and Sentazon were sampled. This included five adits in addition to the Magnata and Muchilera Adits for which results have been previously announced. The significant new results are listed in Table 2 with the locations of the Adits channel sampled shown in Figure 2.

| Channel     | From | То   | Total | Gold  | Ag    | Zn  | Cu  | Pb  | Au Equiv | Comments         |

 Table 2 - Significant underground channel sample results Magnata-Sentazon

 (See Table 3 for information regarding AuEq reported under the JORC Code)

All the Adits, with the exception of Cal III, which is located north of the Magnata fault returned, significant high-grade mineralisation. Highlights include 9.0 metres at 26.7 g/t AuEq (26.1 g/t gold, 50.8 g/t silver, 0.1% zinc) including 6.9 metres at 34.0 g/t AuEq (33.1 g/t gold, 60.9 g/t silver, 0.1 % zinc) in Labor 5. Results of 10.5 metres at 14.0 g/t AuEq (11.2 g/t gold, 215.3 g/t silver, 1.0% zinc) including 6.8 metres at 21.3 g/t AuEq (17.0 g/t gold, 328.7 g/t silver, 1.5 % zinc) in Labor 6, and 6.5 metres at 8.9 g/t AuEq (5.5 g/t gold, 44.3 g/t silver, 6.4 % zinc) from additional sampling at Magnata.

Challenger Exploration Limited ACN 123 591 382 ASX: CEL **Issued Capital** 808.7m shares 86.6m options 120m perf shares 16m perf rights Australian Registered Office Level 1 1205 Hay Street West Perth WA 6005 Directors Mr Kris Knauer, MD and CEO Mr Scott Funston, Finance Director Mr Fletcher Quinn, Chairman

These significant and extensive high-grade results, coupled with the previously reported high-grade underground channel sample results from the Magnata and Muchilera Adits, which included results such as 12.0 metres at 16.5 g/t AuEq including 3.7m at 38.9 g/t AuEq and 22.5 metres at 12.9 g/t AuEq, support the likelihood of a continuous zone of high-grade mineralisation extending over at least 600 metres from Magnata in the north to Sentazon in the south.

Of note was the underground channel sampling in the Cal II adit that returned results including **8.2m** at **2.2** g/t AuEq (**1.1** g/t gold, **76.6** g/t silver, **0.3%** zinc) within a broader zone of **26.9** metres at **1.4** g/t AuEq (**0.8** g/t gold, **43.2** g/t silver, **0.2%** zinc). Cal II is located midway between Magnata and Muchilera in an area of limited drilling by the Company. Only two drillholes (both assays pending) are located in the 250 metres of strike between GNDD-017 (1.7 metres at 1.5 g/t AuEq) and GNDD-085 (1.3 metres at 6.5 g/t AuEq and 2.2 metres at 2.4 g/t AuEq). Given the sampling in the Cal II adit has shown that mineralisation exists in the centre of this 250 metre zone of limited drilling, CEL will follow up these results with new drilling. Additionally, channel CIIINV10-01B at Cal III started in mineralisation grading **2.2** g/t AuEq and channel CIIINV-10-02 at Cal III started and ended in mineralisation grading **1.3** g/t AuEq and **1.84** g/t AuEq.

## Sentazon

The location of the Sentazon channel sampling in relation to the drilling at Sentazon is shown in Figure 3. The results which include 12.0 metres at 9.3 g/t AuEq (8.3 g/t gold, 28.9 g/t silver, 1.4% zinc), 25.7 metres at 5.5 g/t AuEq (2.0 g/t gold, 8.1 g/t silver, 7.7% zinc), including 6.2 metres at 8.5 g/t AuEq (7.0 g/t gold, 17.0 g/t silver, 3.0% zinc) and 30.7 metres at 7.7 g/t AuEq (0.9 g/t gold, 70.2 g/t silver, 13.5% zinc) are shown in Table 3.

The channel sampling has confirmed the extension of the Sentazon Manto 100 metres up-dip from the Company's drilling (Figure 3), and demonstrated excellent continuity of the skarn mineralisation over the entire 50 metre strike extent covered by the Sentazon Adit (Figure 4).

Additionally, channel sampling confirmed the presence of broad zones of remnant lower grade mineralisation including 52.0 metres at 3.4 g/t AuEq (1.3 g/t gold, 7.9 g/t silver, 4.5% zinc) including 25.7 metres at 5.5 g/t AuEq (2.0 g/t gold, 8.1 g/t silver, 7.7% zinc) and 30.4 metres at 2.2 g/t AuEq (1.2 g/t gold, 8.8 g/t silver, 1.9% zinc). These broad zones of halo mineralisation surround the higher-grade mineralisation and were missed by the selective historical sampling; however, they may be important in the context of potential open pit mining given the near surface location.

The Company has now completed a series of infill holes at Sentazon (Figure 3). Assay results for GNDD-209, GNDD-214 and GNDD-239 are pending however all three holes have intersected zones of strong skarn alteration containing massive to semi massive sulphides in the prognosed position of the main Sentazon Manto.

Channel sampling in the Bicolor Adit, located between Sentazon and Flor de Hualilan, also returned mineralisation. Given the small size of the workings only limited sampling was possible, however the result of **1.9 metres at 0.5 g/t AuEq** confirmed the presence of skarn mineralisation between Sentazon and Flor de Hualilan.

See below for information regarding AuEq reported under the JORC Code.

## <sup>2</sup> Gold Equivalent (AuEq) values - Requirements under the JORC Code

• Assumed commodity prices for the calculation of AuEq is Au US\$1780 Oz, Ag US\$24 Oz, Zn US\$2,800 /t

 Metallurgical recoveries for Au, Ag and Zn are estimated to be 89%, 84% and 79% respectively (see JORC Table 1 Section 3 Metallurgical assumptions) based on metallurgical test work.

• The formula used: AuEq (g/t) = Au (g/t) + [Ag (g/t) x (24/1780) x (0.84/0.89)] + [Zn (%) x (28.00\*31.1/1780) x (0.79/0.89)]

• CEL confirms that it is the Company's opinion that all the elements included in the metal equivalents calculation have a reasonable potential to be recovered and sold.

## **About Challenger Exploration**

Challenger Exploration Limited's (ASX: CEL) aspiration is to become a globally significant gold producer. The Company is developing two complementary gold/copper projects in South America. The strategy for the Hualilan Gold project is for it to provide a high-grade low capex operation in the near term. This underpins CEL with a low risk, high margin source of cashflow while it prepares for a much larger bulk gold operation in Ecuador.

- 1. **Hualilan Gold Project**, located in San Juan Province Argentina, is a near term development opportunity. It has extensive historical drilling with over 150 drill-holes and a non-JORC historical resource <sup>(1)</sup> of 627,000 Oz @ 13.7 g/t gold which remains open in most directions. The project was locked up in a dispute for the past 15 years and as a consequence had seen no modern exploration until CEL acquired the project in 2019. Results from CEL's first drilling program included 6.1m @ 34.6 g/t Au, 21.9 g/t Ag, 2.9% Zn, 6.7m @ 14.3 g/t Au, 140 g/t Ag, 7.3% Zn and 10.3m @ 10.4 g/t Au, 28 g/t Ag, 4.6% Zn. This drilling intersected high-grade gold over almost 2 kilometres of strike and extended the known mineralisation along strike and at depth in multiple locations. Recent drilling has demonstrated this high-grade skarn mineralisation is underlain by a significant intrusion-hosted gold system with intercepts including 116m at 1.0 g/t Au, 4.0 g/t Ag, 0.2% Zn and 39.0m at 5.5 g/t Au, 2.0 g/t Ag, 0.3% Zn in porphyry dacites. CEL's current fully funded program includes 120,000 metres of drilling, metallurgical test work of key ore types, and an initial JORC Compliant Resource and PFS.
- 2. El Guayabo Gold/Copper Project covers 35 sqkms in southern Ecuador and was last drilled by Newmont Mining in 1995 and 1997 targeting gold in hydrothermal breccias. Historical drilling has demonstrated potential to host significant gold and associated copper and silver mineralisation. Historical drilling has returned a number of intersections including 156m @ 2.6 g/t Au, 9.7 g/t Ag, 0.2% Cu and 112m @ 0.6 % Cu, 0.7 g/t Au, 14.7 g/t which have never been followed up. The Project has multiple targets including breccia hosted mineralisation, an extensive flat lying late stage vein system and an underlying porphyry system target neither of which has been drill tested. CEL's first results confirm the discovery of large-scale gold system with over 250 metres of bulk gold mineralisation encountered in drill hole ZK-02 which contains a significant high-grade core of 134m at 1.0 g/t gold and 4.1 g/t silver including 63m at 1.6 g/t gold and 5.1 g/t silver.

^ Source: La Mancha Resources Toronto Stock Exchange Release dated 14 May 2003 -Independent Report on Gold Resource Estimate. Rounding errors may be present. Troy ounces (oz) tabled here

<sup>#1</sup> For details of the foreign non-JORC compliant resource and to ensure compliance with LR 5.12 please refer to the Company's ASX Release dated 25 February 2019. These estimates are foreign estimates and not reported in accordance with the JORC Code. A competent person has not done sufficient work to clarify the foreign estimates as a mineral resource in accordance with the JORC Code. It is uncertain that following evaluation and/or further exploration work that the foreign estimate will be able to be reported as a mineral resource. The company is not in possession of any new information or data relating to the foreign estimates or CEL's ability to verify the foreign estimates estimate as minimal resources in accordance with Appendix 5A (JORC Code). The company confirms that the supporting information provided in the initial market announcement on February 25, 2019 continues to apply and is not materially changed.

## **Competent Person Statement – Exploration results**

The information that relates to sampling techniques and data, exploration results and geological interpretation has been compiled Dr Stuart Munroe, BSc (Hons), PhD (Structural Geology), GDip (AppFin&Inv) who is a full-time employee of the Company. Dr Munroe is a Member of the AusIMM. Dr Munroe has over 20 years' experience in the mining and metals industry and qualifies as a Competent Person as defined in the JORC Code (2012).

Dr Munroe has sufficient experience of relevance to the styles of mineralisation and the types of deposits under consideration, and to the activities undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results. Dr Munroe consents to the inclusion in this report of the matters based on information in the form and context in which it appears. The Australian Securities Exchange has not reviewed and does not accept responsibility for the accuracy or adequacy of this release.

## **Competent Person Statement – Foreign Resource Estimate**

The information in this release provided under ASX Listing Rules 5.12.2 to 5.12.7 is an accurate representation of the available data and studies for the material mining project. The information that relates to Mineral Resources has been compiled by Dr Stuart Munroe, BSc (Hons), PhD (Structural Geology), GDip (AppFin&Inv) who is a full-time employee of the Company. Dr Munroe is a Member of the AusIMM. Dr Munroe has over 20 years' experience in the mining and metals industry and qualifies as a Competent Person as defined in the JORC Code (2012).

Dr Munroe and has sufficient experience which is relevant to the style of mineralisation and type of deposits under consideration to qualify as Competent Person as defined in the 2012 Edition of the JORC Code for Reporting of, Mineral Resources and Ore Reserves. Dr Munroe consents to the inclusion in this report of the matters based on information in the form and context in which it appears. The Australian Securities Exchange has not reviewed and does not accept responsibility for the accuracy or adequacy of this release.

## JORC Code, 2012 Edition – Table 1 report template

## Section 1 Sampling Techniques and Data -Hualilan Project

(Criteria in this section apply to all succeeding sections.)

| Criteria            | JORC Code explanation  | Commentary  |
|---------------------|--|---|
| Sampling techniques | <ul> <li>Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.</li> <li>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</li> <li>Aspects of the determination of mineralisation that are Material to the Public Report.</li> <li>In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</li> </ul> | <ul> <li>For historic exploration data, there is little information provided by previous explorers to detail sampling techniques. Drill core was cut with a diamond saw longitudinally and one half submitted for assay. Assay was generally done for Au. In some drill campaigns, Ag and Zn were also analysed. There is limited multielement data available. No information is available for RC drill techniques and sampling.</li> <li>For CEL drilling, diamond core (HQ3) was cut longitudinally on site using a diamond saw. Samples lengths are from 0.5m to 2.0m in length (average 1m), taken according to lithology, alteration, and mineralization contacts.</li> <li>For CEL reverse circulation (RC) drilling, 2-4 kg sub-samples from each 1m drilled are collected from a face sample recovery cyclone mounted on the drill machine.</li> <li>CEL channel samples are cut into underground or surface outcrop using a hand-held diamond edged cutting tool. Parallel saw cuts 3-5cm apart are cut 2-4cm deep into the rock which allows for the extraction of a representative sample using and hammer and chisel. The sample is collected onto a plastic mat and collected into a sample bag.</li> <li>Core and channel samples were crushed to approximately 85% passing 2mm. A 500g or a 1 kg sub-sample was taken and pulverized to 85% passing 75µm. A 50g charge was analysed for Au by fire assay with AA determination. Where the fire assay grade is &gt; 10 g/t gold, a 50g charge was analysed for Au by Fire assay with gravimetric determination.</li> <li>A 10g charge was analysed for 48 elements by 4-acid digest and ICP-MS determination. Elements determined were Ag, As, Ba, Be, Bi, Ca, Ce, Co, Cr, Cs, Cu, Fe, Ga, Ge, Hf, In, K, La, Li, Mg, Mn, Mo, Na, Nb, Ni, P, Pb, Rb, Re, S, Sb Sc, Se, Sn, Sr, Ta, Te, Th, Ti, TU, V, W, Y, Zn and Zr.</li> <li>Ag 100 g/t, Zn, Pb and Cu &gt; 10,000 ppm and S &gt; 10% were re-analysed by the same method using a different calibration.</li> <li>Sample intervals were selected according to geological boundaries. There was no coarse gold observed</li></ul> |
| Drilling techniques | <ul> <li>Drill type (eg core, reverse circulation, open-hole hammer,<br/>rotary air blast, auger, Bangka, sonic, etc) and details (eg<br/>core diameter, triple or standard tube, depth of diamond<br/>tails, face-sampling bit or other type, whether core is<br/>oriented and if so, by what method, etc).</li> </ul>  | Collar details for diamond core drilling (DD) and reverse circulation (RC) historic drilling campaigns is provided below from archival data cross checked with drill logs and available plans and sections where available. Collars shown below are in WGS84, zone 19s which is the standard projection used by CEL for the Project. Collar locations have been check surveyed using differential GPS (DGPS) by CEL to verify if the site coincides with a marked collar or tagged drill site. In most cases the drill collars coincide with  |

## Criteria Quality o

### JORC Code explanation

Quality of assay data and laboratory tests

- The nature quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.
- For geophysical tools spectrometers handheld XRF instruments etc the parameters used in determining the analysis including instrument make and model reading times calibrations factors applied and their derivation etc.
- Nature of quality control procedures adopted (eg standards blanks duplicates external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.

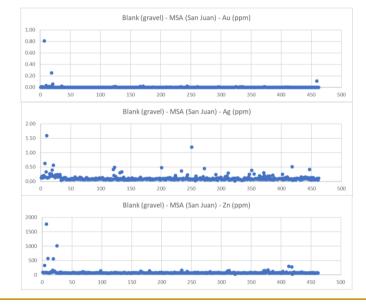

### Commentary

The MSA laboratory used for sample preparation in San Juan has been inspected by Stuart Munroe (Exploration Manager) and Sergio Rotondo (COO) prior to any samples being submitted. The laboratory procedures are consistent with international best practice and are suitable for samples from the Project. The ALS laboratory in Mendoza has not yet been inspected by CEL representatives.

Internal laboratory standards were used for each job to ensure correct calibration of elements.

CEL submit blank samples (cobble and gravel material from a quarry nearby to Las Flores San Yuan) to both the MSA laboratory and the ALS laboratory which were strategically placed in the sample sequence immediately after samples that were suspected of containing high grade Au Ag Zn or Cu to test the lab preparation contamination procedures. The values received from the blank samples suggest rare cross contamination of samples during sample preparation.

13 blank samples have been submitted with the channel samples where final results been received. The blank sample results are consistent with the blank results submitted with the drill core samples and no unexpected results have been returned.

The verification of significant intersections by either independent or alternative company personnel.

The use of twinned holes.

Documentation of primary data data entry procedures data verification data storage (physical and electronic) protocols.

Discuss any adjustment to assay data.

Repeat sampling of 186 coarse reject samples from 2019 drilling has been done to verify sampling. Original samples were from the 2019 DD drilling which were analysed by MSA (San Juan preparation and Vancouver analysis). Repeat samples were analysed by ALS (Mendoza preparation and Vancouver analysis). The repeat analysis technique was identical to the original. The repeat analyses correlate very closely with the original analyses providing a high confidence in the sample preparation and analysis from MSA and ALS. A summary of the results for the 186 sample pairs for key elements is provided below:

|                                  | Mean  |       | Median |      | Std Devia | ation |                            |

|                                  |  | analysis of the twin holes has yet to be completed. The holes are:   |  |  |  |  |
|                                  |  | GNDD003 – DDH34 and 04HD08   |  |  |  |  |
|                                  |  | GNRC110 – DDH53<br>GNDD144 – 05HD39  |  |  |  |  |
|                                  |  | GNRC107 – GNDD008/008A   |  |  |  |  |
|                                  |  | GNDD206 – DDH54  |  |  |  |  |
|                                  |  | Final sample assay analyses are received by digital file in PDF and CSV format. The original files are backed-up and the data copied into a drill hole database for geological modelling.  |  |  |  |  |
|                                  |  | Assay results summarised in the context of this report have been rounded appropriately to 2 significan figures. No assay data have been otherwise adjusted.  |  |  |  |  |
| Location of data<br>points       | <ul> <li>Accuracy and quality of surveys used to locate drill holes<br/>(collar and down-hole surveys) trenches mine workings<br/>and other locations used in Mineral Resource estimation.</li> <li>Specification of the grid system used.</li> </ul>  | Argentinian SGM survey. The locations have been surveyed in POSGAR 2007 zone 2 and converted to  |  |  |  |  |
|                                  | <ul> <li>Specification of the grid system used.</li> <li>Quality and adequacy of topographic control.</li> </ul>   | Following completion of the channel sampling, the location of the channel samples taken underground surveyed from a survey mark at the entrance to the underground which is located using differential GPS. The locations have been surveyed in POSGAR 2007 zone 2 and converted to WGS84 UTM zone 19s.  |  |  |  |  |
|                                  |  | The drill machine is set-up on the drill pad using hand-held equipment according to the proposed hole design.  |  |  |  |  |
|                                  |  | Diamond core drill holes are surveyed at 30-40m intervals down hole using a Reflex tool. RC drill holes are surveyed down hole every 10 metres using a gyroscope to avoid magnetic influence from the drill rods.  |  |  |  |  |
|                                  |  | All current and previous drill collar sites, Minas corner pegs and strategic surface points have been surveyed using DGPS to provide topographic control for the Project.  |  |  |  |  |
| Data spacing and<br>distribution | <ul> <li>Data spacing for reporting of Exploration Results.</li> <li>Whether the data spacing and distribution is sufficient to<br/>establish the degree of geological and grade continuity<br/>appropriate for the Mineral Resource and Ore Reserve<br/>estimation procedure(s) and classifications applied.</li> </ul> | No regular drill hole spacing has been applied across the Project, although a nominal 40m x 40m dril<br>spacing is being applied to infill and extension drilling where appropriate. The current drilling is desi<br>to check previous exploration, extend mineralisation along strike, and provide some information to<br>establish controls on mineralization and exploration potential. No Mineral Resource Estimate to JOF<br>2012 reporting standards has been made at this time. |  |  |  |  |
|                                  | - Whether sample compositing has been applied.   | Samples have not been composited.  |  |  |  |  |

| Criteria  | JORC Code explanation  | Commentary  |
|---|--|---|
| Orientation of data<br>in relation to<br>geological structure | <ul> <li>Whether the orientation of sampling achieves unbiased<br/>sampling of possible structures and the extent to which<br/>this is known considering the deposit type.</li> <li>If the relationship between the drilling orientation and the<br/>orientation of key mineralised structures is considered to<br/>have introduced a sampling bias this should be assessed<br/>and reported if material.</li> </ul> | As far as is currently understood and where practicable, the orientation of sampling achieves unbiased sampling of structures and geology controlling the mineralisation.<br>For underground channel sampling, the orientation of the sample is determined by the orientation of the workings. Where the sampling is parallel with the strike of the mineralisation, plans showing the location of the sampling relative to the orientation of the mineralisation, weighted average grades and estimates of true thickness are provided to provide a balanced report of the mineralisation that has been sampled.<br>Drilling has been designed to provide an unbiased sample of the geology and mineralisation targeted. |
| Sample security   | - The measures taken to ensure sample security.  | Samples were under constant supervision by site security, senior personnel and courier contractors prior to delivery to the preparation laboratories in San Juan and Mendoza.   |
| Audits or reviews   | <ul> <li>The results of any audits or reviews of sampling<br/>techniques and data.</li> </ul>  | There has not yet been any independent reviews of the sampling techniques and data.   |

| D  |   | <ul> <li>of high-grade results and longer lengths of low-grade results the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.</li> <li>The assumptions used for any reporting of metal equivalent values should be clearly stated.</li> </ul> | Metallurgical recoveries for Au, Ag and Zn have been estimated from metallurgical test work completed by SGS Metallurgical Operations in Lakefield, Ontario using a combination of gravity and flotation of a combined metallurgical sample from 5 drill holes. Using data from the test results, and for the purposes of the AuEq calculation gold recovery is estimated at 89%, silver at 84% and zinc at 79%. Accordingly, the formula used is AuEq (g/t) = Au (g/t) + [Ag (g/t) x (24/1780) x (0.84/0.89)] + [Zn (%) x (28.00*31.1/1780) x (0.79/0.89)]. Metallurgical test work and geological and petrographic descriptions suggest all the elements included in the metal equivalents calculation have a reasonable potential of eventual economic recovery. While Cu and Pb are reported in the table above, these metals are not used in the Au equivalent calculation at this early stage of the Project. |
|    |   |   | No top cuts have been applied to the reported grades.   |
|    | Relationship<br>between<br>mineralisation               | reporting of Exploration Results.<br>- If the geometry of the mineralisation with respect to  | The mineralisation is moderately or steeply dipping and strikes NNE and ENE. For some drill holes, there is insufficient information to confidently establish the true width of the mineralized intersections at this stage of the exploration program.   |
|    | widths and<br>intercept lengths                         | reported  | Apparent widths may be thicker in the case where bedding-parallel mineralisation may intersect ENE-striking cross faults and veins.   |

## Section 3 Estimation and Reporting of Mineral Resources

## (Criteria listed in the preceding section also apply to this section.)

| Criteria                     | JORC Code explanation  | Commentary  |
|------------------------------|--|---|
| Database integrity           | <ul> <li>Measures taken to ensure that data has not been corrupted by for<br/>example transcription or keying errors between its initial collection and<br/>its use for Mineral Resource estimation purposes.</li> <li>Data validation procedures used.</li> </ul>                         | Geological logging completed by previous explorers was done on paper copies and transcribed into<br>the drill hole database. The data was checked for errors. Checks can be made against the original<br>logs and core photographs.   |
|                              |  | Assay data is received in digital format. Backup copies are kept and the data is copied into the drill hole database.   |
|                              |  | The drill hole data is backed up and is updated periodically by a Company GIS and data team.  |
| Site visits                  | <ul> <li>Comment on any site visits undertaken by the Competent Person and the outcome of those visits.</li> <li>If no site visits have been undertaken indicate why this is the case.</li> </ul>  | Site visits have been undertaken from 3 to 16 October 2019 15 to 30 November 2019 and 1-19<br>February 2020. The performance of the drilling program collection of data and sampling procedures<br>were initiated during these visits.  |
| Geological<br>interpretation | <ul> <li>Confidence in (or conversely the uncertainty of) the geological<br/>interpretation of the mineral deposit.</li> <li>Nature of the data used and of any assumptions made.</li> <li>The effect if any of alternative interpretations on Mineral Resource<br/>estimation.</li> </ul> | The interpretation is considered appropriate given the stage of the project and the nature of activities that have been conducted. The interpretation captures the essential geometry of the mineralised structure and lithologies with drill data supporting the findings from the initial underground sampling activities.  |
|                              | <ul> <li>The use of geology in guiding and controlling Mineral Resource estimation.</li> <li>The factors affecting continuity both of grade and geology.</li> </ul>  | The most recent resource calculation (2006 and 2003 – La Mancha) used all core drilling at the time<br>and detailed underground channel sampling collected by EPROM CMEC and La Mancha. Overlying<br>assumptions included a reduction of the calculated grade in each resource block by a factor of 10% to<br>account for possible errors in the analyses and samples. An arbitrary reduction factor was applied to<br>the 2006 resource whereby the net reported tonnage was reduced by 25% for indicated resource   |
|                              |  | blocks 50% for inferred resource blocks and 75% of potential mineral resource blocks. The reason for<br>the application of these tonnage reduction factors was not outlined in the resource report. It is noted<br>that at the time of this report La Mancha was in a legal dispute concerning the project with its joint<br>venture partner and given the acquisition of a 200000 Oz per annum producing portfolio the project<br>was likely no longer a core asset for La Mancha at that time. Additionally, under the original<br>acquisition agreement La Mancha had to issue additional acquisition shares based on resource<br>targets. |
|                              |  | The effect of removing the assumptions relating to application of the arbitrary tonnage reduction factors applied increases the overall resource tonnage by in excess of 50%. Removing these correction factors would bring the overall tonnage and grade close the earlier (2003 1999 and 1996)  |

|--|--|---|
|  |  | No assumptions were made regarding correlation between variables.   |
|  |  | The mineralisation is defined within skarn and associated vein deposits. Detailed cross section and plan maps were prepared for these domains with their shapes used in controlling the resource estimate. Long sections of the veins and skarn were taken and sampling was plotted and the blocks outlined considering this.   |
|  |  | Grade cutting was not used in the calculation of the resource and no discussion was given as to why it was not employed. It is recommended that a study be undertaken to determine if an appropriate top cut need be applied No data is available on the process of validation.   |
| Moisture                                   | <ul> <li>Whether the tonnages are estimated on a dry basis or with natural<br/>moisture and the method of determination of the moisture content.</li> </ul>  | No data is available.   |
| Cut-off<br>parameters                      | - The basis of the adopted cut-off grade(s) or quality parameters applied.   | The Mineral Resource Estimate is above a cut-off grade of 3.89 g/t Au. This is based on the assumed mining cost at the time of the estimate.  |
| Mining factors or<br>assumptions           | - Assumptions made regarding possible mining methods minimum<br>mining dimensions and internal (or if applicable external) mining<br>dilution. It is always necessary as part of the process of determining<br>reasonable prospects for eventual economic extraction to consider<br>potential mining methods but the assumptions made regarding mining<br>methods and parameters when estimating Mineral Resources may not<br>always be rigorous. Where this is the case this should be reported with<br>an explanation of the basis of the mining assumptions made. | <ul> <li>The Mineral Resource Estimate considered the assumptions outlined below which are considered appropriate; <ul> <li>Metal prices: Au US\$550 Oz Ag US\$10 Oz</li> <li>Metallurgical Recovery; Au – 80% Ag – 70% Zn - nil</li> <li>Operating cost: US\$55t based on underground cut and fill mining and flotation and cyanidation combined</li> </ul> </li> <li>The minimum mining width of 0.8m was assumed for veins less than 0.6m and for wider widths a dilution of 0.2m was used to calculate the grade.</li> </ul>  |
| Metallurgical<br>factors or<br>assumptions | - The basis for assumptions or predictions regarding metallurgical<br>amenability. It is always necessary as part of the process of determining<br>reasonable prospects for eventual economic extraction to consider<br>potential metallurgical methods but the assumptions regarding<br>metallurgical treatment processes and parameters made when<br>reporting Mineral Resources may not always be rigorous. Where this is<br>the case this should be reported with an explanation of the basis of the<br>metallurgical assumptions made.                          | <ul> <li>Historical metallurgical test-work assumptions were 80% recovery for Au, Ag and Zn.</li> <li>The most recent historic test work was conducted in 1999 by Lakefield Research<br/>(cyanidation) and CIMM Labs (flotation) in Chile on 4 samples which all contain primary<br/>sulphide minerals and so can be considered primary, partial oxide or fracture oxide<br/>samples.</li> <li>The test work was conducted using a 150 micron grind which would appear to coarse based<br/>on petrography conducted by CEL which shows that the gold particles average 30-40<br/>microns.</li> <li>Rougher flotation tests were performed with a 20 minute and 30 minute floatation time.<br/>Generally, the longer residence time improved recovery. Recoveries to concentrate for<br/>gold range from 59.6% - 80.6% and for silver from 63.1% – 87.2%.</li> </ul> |

|               |  | <ul> <li>Knelson concentrate tests with floatation of tailings were also completed. Applying a joir process Knelson concentrator and floatation of the tailings of the concentrator it is found that the global recovery is approximately 80% for gold.</li> <li>While the testwork was focused predominantly on gold recovery some rougher flotation testwork was undertaken targeting Zn recovery producing up to 85% recoveries. In sulphide samples this produced a Zn concentrate containing 42% Zn with grades in excess of 50% Zn in concentrate expected with additional floatation stages.</li> <li>The report concluded that it was possible to produce a commercial Au-Ag concentrate an a Zn concentrate.</li> <li>Extraction of gold and silver by cyanidation was tested on 3/8 and % inch (9.525mm and 19.05mm) crush sizes that are designed to test a heap leach processing scenario. Bottler of these crush size resulted in 41-39% gold recovery and 31-32% silver recovery with high cyanide consumption. No tests have been done on material at a finer grind size.</li> <li>More recently, CEL has completed initial metallurgical test work on a 147 kg composite sample of drill core from GMDD039, GMDD040, GMDD041, GNDD043, GNDD003 and GNDD018. The sample is of skarn mineralisation in limestone that has a weighted average grade of 10.4 g/t A 31.7 g/t Ag, 3.2 % Zn, 0.15 % Cu and 0.46 % Pb. Separate tests on 2 kg sub-samples were done with differing grinding times, Knelson and Mosley table gravity separation techniques and floatation techniques to provide a series of gravity and floatation concentrates. Key results ar</li> <li>Combined gravity and floatation concentration process resulted in recoveries to Zn.</li> <li>A simple gravity separation followed by a sulfide flotation process when re-combined produced a single product with a median grade of 47 g/t Au, 120 g/t Ag and 13% Zn with recovered weight of 24-33% of the sample weight.</li> <li>Tailings fragment analysis indicates a grind of (pag) 72-106 µm. Generally,</li></ul> |
|               |  | - Sulphides present are dominated by pyrite and sphalerite. Also present are chalcopyrite, pyrrhotite, chalcocite, bornite and galena.   |
| Environmental | - Assumptions made regarding possible waste and process residue  | It is considered that there are no significant environmental factors which would prevent the eventu  |
| factors or    | disposal options. It is always necessary as part of the process of   | extraction of gold from the project. Environmental surveys and assessments will form a part of future  |
| assumptions   | determining reasonable prospects for eventual economic extraction to<br>consider the potential environmental impacts of the mining and | pre-feasibility.   |

|   |   | The earlier (1996 and 2000) Mineral Resource Estimates were audited and re-stated in a 2003 resource report. This independent report was done to NI-43-101 standard and the results of this report were released to the TSX. This report concluded that "Detailed resource calculations made by three different groups are seen to be realistic.                          |  |  |  |
| Discussion of<br>relative accuracy/<br>confidence | - Where appropriate a statement of the relative accuracy and confidence<br>level in the Mineral Resource estimate using an approach or procedure<br>deemed appropriate by the Competent Person. For example the<br>application of statistical or geostatistical procedures to quantify the<br>relative accuracy of the resource within stated confidence limits or if | ,   |  |  |  |
|   | <ul> <li>such an approach is not deemed appropriate a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.</li> <li>The statement should specify whether it relates to global or local estimates and if local state the relevant tonnages which should be</li> </ul>   | Grade continuity is variable in nature in this style of deposit and has not been demonstrated to date<br>and closer spaced drilling is required to improve the understanding of the grade continuity in both<br>strike and dip directions. It is noted that the results from the twinning of three holes by La Mancha<br>are encouraging in terms of grade repeatability. |  |  |  |
|   | <ul> <li>relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.</li> <li>These statements of relative accuracy and confidence of the estimate should be compared with production data where available.</li> </ul>  | The deposit contains very high grades and there is a potential need for the use of a top cut. It is noted that an arbitrary grade reduction factor of 10% has already been applied to the resource as reported.   |  |  |  |
|   |   | No production data is available for comparison  |  |  |  |
