General Statement and Cautionary Statement

This presentation has been prepared by Lake Resources N.L (Lake) for information purposes and meetings with sophisticated and professional investors, institutional investors and brokers and not any particular party. The information in this presentation is based upon public information and internally developed data and reflects prevailing conditions and views as of this date, all of which are accordingly subject to change. The information contained in this presentation is of general nature and is not intended to address the circumstances of any particular individual or entity. There is no guarantee that the information is accurate as of the date it is received or that it will continue to be accurate in the future. No warranties or representations can be made as to the origin, validity, accuracy, completeness, currency or reliability of the information. No one should act upon such information without appropriate professional advice after a thorough examination of the particular situation. Lake Resources NL accepts no responsibility or liability to any party in connection with this information or views and Lake disclaims and excludes all liability (to the extent permitted by law) for losses, claims, damages, demands, costs and expenses of whatever nature arising in any way out of or in connection with the information, its accuracy, completeness or by reason of reliance by any person on any of it. The information regarding projects described in this presentation are based on exploration targets, apart from the Kachi project's resource statement. The potential quantity and grade of an exploration target is conceptual in nature, with insufficient exploration to determine a mineral resource and there is no certainty that further exploration work will result in the determination of mineral resources or that potentially economic quantities of lithium will be discovered. Some leases are located within and around the Orocobre, Orocobre/Advantage Lithium and Ganfeng/Lithium Americas projects and although data is limited within the properties, the leases may cover potential extensions to the Cauchari/Olaroz projects with potential extensions to aquifers. although this provides no assurance that any resource will be identified on the Lake leases. The lithium pegmatite leases occur adjacent to past producers of spodumene but no potential extension to any mineralisation can be assured.

Forward Looking Statements

Certain statements contained in this presentation, including information as to the future financial performance of the projects, are forward-looking statements. Such forward-looking statements are necessarily based upon a number of estimates and assumptions that, while considered reasonable by Lake Resources N.L. are inherently subject to significant technical, business, economic, competitive, political and social uncertainties and contingencies; involve known and unknown risks and uncertainties and other factors that could cause actual events or results to differ materially from estimated or anticipated events or results, expressed or implied, reflected in such forward-looking statements; and may include, among other things, statements regarding targets, estimates and assumptions in respect of production and prices, operating costs and results, capital expenditures, reserves and resources and anticipated flow rates, and are or may be based on assumptions and estimates related to future technical, economic, market, political, social and other conditions and affected by the risk of further changes in government regulations, policies or legislation and that further funding may be required, but unavailable, for the ongoing development of Lake's projects. Lake Resources N.L. disclaims any intent or obligation to update any forward-looking statements, whether as a result of new information, future events or results or otherwise. The words "believe", "expect", "anticipate", "indicate", "contemplate", "target", "plan", "intends", "continue", "budget", "estimate", "may", "will", "schedule" and similar expressions identify forward-looking statements. All forward-looking statements made in this presentation are qualified by the foregoing cautionary statements. Investors are cautioned that forward-looking statements are not guarantees of future performance and accordingly investors are cautioned not to put undue reliance on forward-looking statements due to the inherent uncertainty therein. Lake does not undertake to update any forward-looking information, except in accordance with applicable securities laws.

Competent Person Statement

The information contained in this presentation relating to Exploration Results has been compiled by Mr Andrew Fulton. Mr Fulton is a Hydrogeologist and a Member of the Australian Institute of Geoscientists and the Association of Hydrogeologists. Mr Fulton has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a competent person as defined in the 2012 edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Andrew Fulton is an employee of Groundwater Exploration Services Pty Ltd and an independent consultant to Lake Resources NL. Mr Fulton consents to the inclusion in this presentation of this information in the form and context in which it appears. The information in this presentation is an accurate representation of the available data to date from initial exploration at the Kachi project and initial exploration at the Cauchari project.

World's cleanest lithium.

Four lithium projects in heart of the Lithium Triangle. Produces 40% of the world's lithium at lowest cost.

Large leaseholding 2,200km² (550,000 acres)

World's five largest producers all have equity in operations in the Lithium Triangle.

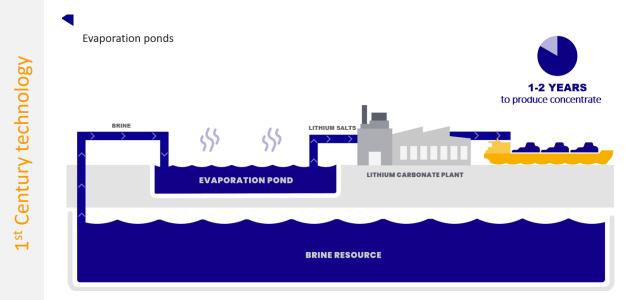

World's cleanest lithium.

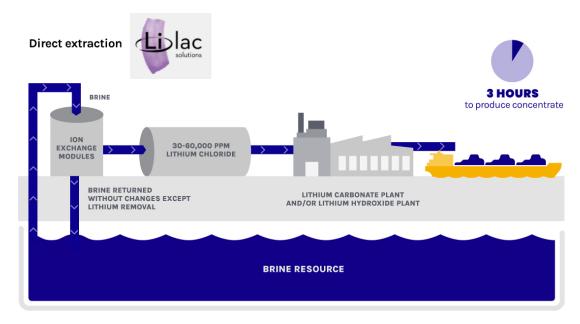

- 99.97%
- High Purity lithium carbonate. Confirmed in batteries.
- + Significant ESG benefits.

- CLEANER LITHIUM Lake's 99.97% purity product far lower impurities vs 99.5% battery grade lithium carbonate. Higher purity lithium = higher battery performance.
- CLEANER TECHNOLOGY: Lilac direct lithium extraction —
 method common in water treatment, superior to
 traditional process. Supported by Bill Gates-led
 Breakthrough Energy Fund.
- CLEANER ENVIRONMENT: Lithium with ESG benefits.
 Smaller environmental footprint low CO₂, less water and low land use.
- CLEARER PATHWAY: Kachi has a demonstrated path to production; Successful pilot plant module.
 Large, scalable project, high margin.

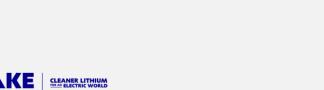

- High purity
- Faster process
- Higher recoveries
- Sustainable
- Cost competitive
- Scalable
- Proven in pilot plant

21st Century technology

Expansion Study*

(to Double Production to 51,000tpa)

* Note: Expansion Study requires drilling (underway) to upgrade more Inferred Resources to Measured and Indicated Resources.

Clearer pathway

Lake's high purity lithium tested and proven in batteries

Lake's lithium carbonate demonstrated in batteries

- Lake's product premium battery quality
- Performs like Tier 1 products in NMC622 batteries
- Only 50-60% of lithium production is battery quality
- Strengthens Lake's quality benefits and assists offtake discussions

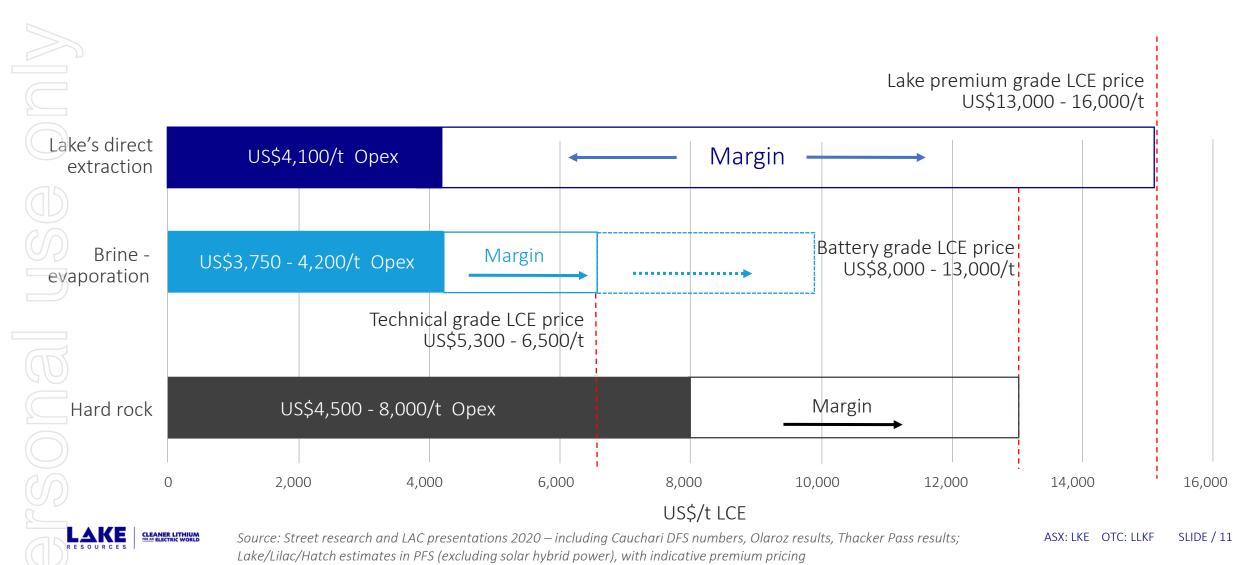

Battery technology leader (ASX:NVX; OTCQX:NVNXF)

- Clients include Panasonic, CATL, Samsung, SK, LG Chem, Bosch, Honda & Dyson
- Developing latest cathode and anode technology

Direct extraction Premium price – very high margin

Kachi project.

Large, scalable resource

25 years production uses 20% of resource.

- Drilling to upgrade resource for expansion; resource open laterally and at depth
- Kachi lease 740 sq km (185,000 acres)
- One of 10 largest brine resources globally total JORC resource 4.4Mt LCE
- Production 25,500tpa H1, 2024
- Export Credit Agencies indicative 10 year
 70% debt funding of Kachi development

Leadership

Board has extensive background in resources sector, backed by experienced on-site team in Argentina.

Steve Promnitz
CEO & MANAGING DIRECTOR

Extensive project management experience in South America – geologist and finance experience – with major companies (Rio, Citi) and mid-tiers.

Stu Crow
CHAIRMAN NON-EXEC

More than 25 years of experience (numerous public companies) and in financial services.

Dr Nicholas LindsayEXEC TECHNICAL DIRECTOR

30 years of experience in Argentina/Chile/Peru (PhD in Metallurgy & Materials Engineering); Major companies (Anglo) and taken companies from inception to development to acquisition in South America.

Dr Robert TrzebskiNON-EXEC DIRECTOR

International mining executive with 30 years experience; operational, commercial and technical experience in global mining incl. Argentina. Extensive global contacts to assist Lake with project development. Chief Operating Officer of Austmine. Director Austral Gold.

CLEANER LITHIUM FOR AN ELECTRIC WORLD

- World's highest purity lithium
- Technology led direct extraction
- Major ESG benefits

Steve Promnitz

Appendices ASX: LKE SLIDE / 20

Market needs 10x to 18x more lithium production by 2030.

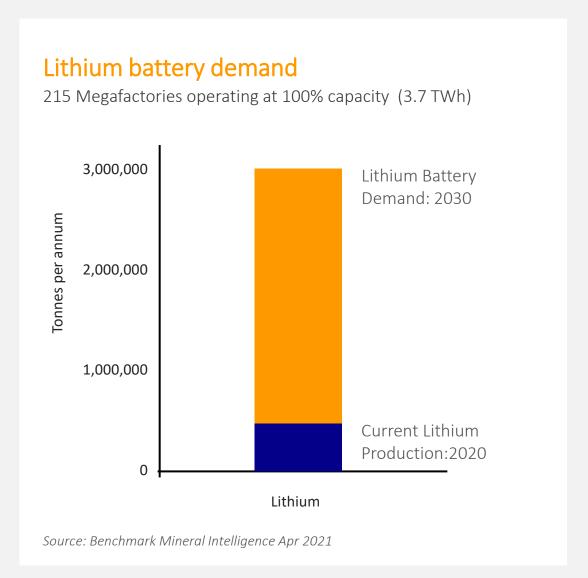

- Lithium added to critical raw materials list for the first time in 2020
- Lithium-ion batteries represent one of the 21st Century's largest growth areas
- Lake's world's purest lithium is exactly what an electric world wants

Underinvestment in new supply. Price moving up.

- Lithium carbonate prices have doubled over past year
- 8 to 18 times more lithium production needed by 2030 to satisfy demand
- Need 7 companies the size of SQM each year for the next 10 years

Sustainable lithium

Lake / Lilac DLE method

- Low CO2 footprint
- Low water usage
- Low land use

Appendix 1 - Kachi Project

	Mining factors or	The resource has been quoted in terms of brine volume, concentration of dissolved elements,
	assumptions	contained lithium and potassium and their products lithium carbonate and potassium chloride.
'		 No mining or recovery factors have been applied although the use of the specific yield (drainable
٠,		porosity) is used to reflect the reasonable prospects for economic extraction with the proposed mining methodology. (Recoveries of 83% lithium have been used in the PFS for the direct processing method)
		Dilution of brine concentrations may occur over time and typically there are lithium and potassium
1		losses in both the storage ponds and processing plant in brine extraction operations. However,
1		potential dilution will be estimated in the groundwater model simulating brine extraction.
		. The conceptual mining method is recovering brine from the Salt Lake via a network of wells, the
1		established practice on existing lithium and potash brine projects.
Ц		Detailed hydrological studies of the lake are being undertaken (groundwater modelling) to define the
	Metallurgical factors or	extractable resources and potential extraction rates. • Lithium carbonate is targeted as the commercial product.
	assumptions	It would be obtained by the brines being subjected to direct lithium extraction (ionic exchange and
		reverse osmosis) to produce a high grade LiCl eluate (30,000 to 60,000 mg/L lithium), which is
		processed in a conventional lithium carbonate plant by reaction with sodium carbonate:
		$LiCI + Na_2CO_3 \rightarrow Li_2CO_3 + NaCI$
1		 Process work has been undertaken by Lilac Solutions, which is an expert laboratory in the treatment of
1		 brines by ion exchange. Bench tests include short and long-term tests using ion exchange media and brine from Kachi to
1		establish recovery, reagent consumption, and engineering parameters used in the PFS
1		Analyses of solutions by ICP and includes the use of standards
1		The longevity of the ion exchange media has been tested over 1000 cycles, or six months
		 Lithium carbonate of high purity and low impurities has been produced which can be considered
1		equivalent to metallurgical test work) is being carried out on the brine following initial test work.
ı		 Pilot plant module test-work has commenced using Kachi brine using Lilac Solutions ion exchange direct
		extraction method. 20,000 litres of Kachi brine was being processed by Lilac into concentrated lithium chloride (eluate).
		Hazen Research Inc has demonstrated the conversion of lithium chloride from the pilot module into
ı		larger volumes of high purity lithium carbonate with purity >99.97% with very low levels of impurities.
4		Hazen processed the eluate from Lilac to produce the lithium carbonate sample using reduction of
		water through evaporation, treatment with sodium hydroxide and soda ash, ion exchange,
		precipitation, filtering and recrystallization.
		Due to the high purity of the lithium carbonate, the lithium is reported as 100% minus the sum of
i		impurities. ICP-MS and ICP-AES assays from the Hazen Research lab were used to assess impurities. Titration (acidimetric titration with HCI) was performed for total Lithium, run in duplicate and resulted
		in assays of 100.2 wt% and 100.3 wt.%. This is the accepted assay technique for larger lithium
		carbonate samples.
		. To ensure consistency of the processing and analysis with industry standards, Dr Nick Welham was
4		consulted and reviewed the results and calculations of purity.
		This work is yet to be integrated into the resource model.
-	Environmental factors as	 Impacts of a lithium operation at the Kachi project would include surface disturbance from the
4	assumptions	installation of extraction/processing facilities and associated infrastructure, accumulation of various salt tailings impoundments and extraction from brine and fresh water aquifers regionally.
		Environmental management plan for the protection of wetlands, salt lakes, and surrounds.
-		Consultation with communities in the area of influence of the project.
J		Environmental impact analysis on-going.
ı	Bulk density	 Density measurements were taken as part of the drill core assessment. This included determining dry
١		density and particle density as well as field measurements of brine density. Note that no mining is to
		be carried out as brine is to be extracted by pumping and consequently sediments are not mined
	Classification	 No bulk density was applied to the estimates because resources are defined by volume, rather than by tonnage. The resource has been classified into the two possible resource categories based on confidence in the
	a.a.a.ayia.a.aa	estimation.
		A Measured resource would reflect higher density drilling, with porosity samples from drill cores and
		well constrained vertical brine sampling in the holes.
		. The Indicated resource reflects the higher confidence in the brine sampling in the rotary drilling and
		lower quality geological control from the drill cuttings.
4		The Inferred resource underlying the Measured and/or Indicated resource reflects the limited drilling
		to this depth together with the geophysics through the property.
1		 In the view of the Competent Person the resource classification is believed to adequately reflect the
		available data and is consistent with the suggestions of Houston et. al., 2011
	Audits or reviews	 The Mineral Resource was estimated by the Competent Person.
	Discussion of relative	An independent estimate of the resource was completed using a nearest neighbour estimate and the
	accuracy/ confidence	comparison of the results with the ordinary kriging estimate is below 0.3% for measured resources and
		below 3% for indicated resources which is considered to be acceptable.
		 Univariate statistics for global estimation bias, visual inspection against samples on plans and sections,
		swath plots in the north, south and vertical directions to detect any spatial bias shows a good
		agreement between the samples and the ordinary kriging estimates.
