

RC DRILLING UNDERWAY AT MULGA BILL

HIGHLIGHTS

- RC drilling has recommenced at Mulga Bill within the Side Well Gold Project
- The 5,000m RC drill program will initially target extensions of high-grade zones along the 6km Mulga Bill – Loaded Dog corridor
- Maiden RC holes at the Ironbark Prospect located 1.5km east of Mulga Bill will test primary gold mineralisation over the defined 500m of strike
- 3D IP survey on track to be completed by mid-April

Great Boulder Resources (“**Great Boulder**” or the “**Company**”) (ASX: **GBR**) is pleased to provide an update on exploration activity at the Side Well Gold Project (“**Side Well**”) in Western Australia.

RC drilling will recommence this morning at Mulga Bill as part of a 5,000m program designed to test extensions to high-grade zones along the 6km Mulga Bill – Loaded Dog corridor.

In addition, the Company will undertake its first round of RC holes to test primary gold mineralisation over the defined 500m of strike at the Ironbark Prospect located 1.5km east of Mulga Bill.

The program is expected to take approximately four weeks to complete. During this time the 3D IP survey will also be completed and processed, and the diamond rig will return to Mulga Bill to complete the program. Both programs were interrupted by adverse weather conditions in late March.

Great Boulder’s Managing Director, Andrew Paterson commented:

“Our Mulga Bill exploration program is continuing at full speed with the commencement of our first RC drill program for 2022. We are well advanced and funded to execute our plans to accelerate drilling later this quarter as we move towards an Exploration Target followed by an initial Mineral Resource Estimate at Side Well.”

“The additional structural data from the diamond drilling program plus the RC data we gain from this program will be the next step in building our understanding of Mulga Bill.”

“The team is looking forward to seeing the full 3D inversion model of chargeability anomalies associated with sulphide once the IP survey is complete, as it will provide our first three-dimensional model of sulphide zones that will be subject to further drilling.”
