ASX ANNOUNCEMENT

For personal use only

27 August 2026

Exceptional wide, high-grade intercept of 226m @ 3.11g/t Au returned from infill drilling at Two Mile Hill

Significant mineralisation from infill drilling targeting increased geological confidence and an upgrade to Indicated classification

HIGHLIGHTS

- Brightstar has received further assay results from reverse circulation and diamond core drilling completed at the **Two Mile Hill-Shillington deposit,** part of the **2.9Moz @ 1.3g/t Au Sandstone Gold Project**.
- Broad intervals of mineralised tonalite reported from infill drilling, targeting areas identified for potential underground mining in ongoing pre-feasibility study workstreams, with visible gold observed throughout the significant intersections, typically associated with galena and pyrite.
- Significant results from within the tonalite include:

  TMHRCD26006A

  A broad, unconstrained intercept of **225.7m @ 3.11g/t Au from 284m**, including:
  - **19m @ 24.3g/t Au** from 306m, including **1m @ 449g/t Au** from 322m
  - **19.1m @ 2.76g/t Au** from 477m, including **0.8m @ 37.9g/t Au** from 477m

  TMHRCD26004

  A broad, unconstrained intercept of **194m @ 2.10g/t Au from 286m**, including:
  - **13m @ 4.35g/t Au** from 322m, including **0.8m @ 53.6g/t Au** from 324.2m
  - **13.3m @ 2.27g/t Au** from 392m, including **1m @ 18.1g/t Au** from 392m
  - **6m @ 5.54g/t Au** from 450m, including **1m @ 30.2g/t Au** from 451m

- The Two Mile Hill-Shillington deposit hosts a current **Mineral Resource Estimate of 14.6Mt @ 1.6g/t Au for 731koz Au**
- This drilling, completed in June, infilled areas above the newly discovered "Shirvington Zone" where deep extensional diamond drilling intersected a much wider tonalite than previously interpreted, with >**300m horizontal thickness**[1]
- Sandstone drilling is ongoing with RC and diamond rigs active across multiple deposits for pre-feasibility study workstreams and **continued extensional drilling at depth at Two Mile Hill**

Brightstar Resources Limited (ASX: BTR) (**Brightstar**) is pleased to announce further assay results from diamond core (**DD**) and reverse circulation (**RC**) drilling programs at the Two Mile Hill-Shillington deposit, part of the **2.9Moz @ 1.3g/t Au** Sandstone Gold Project.

The new results follow on from recently reported drilling[2], including **305m @ 1.8g/t Au** (*TMHRCD26020*), and aimed to infill areas of the deposit optimised for underground mining, **targeting increased confidence and an upgrade to the Indicated classification.**

The infill drilling complements the ongoing deep exploration program targeting the "Shirvington Zone" at Two Mile Hill, which sits outside of the existing Mineral Resource Estimate (**MRE**). Initial results from this deeper drilling have identified significant visible gold occurrences within 400–500m widths of the mineralised tonalite host unit.

Brightstar's Managing Director, Alex Rovira, commented:

"The latest results continue to demonstrate the broad widths of the Two Mile Hill deposit and high-grade nature of the quartz veining within the host tonalite, with individual grades reaching 449g/t Au. These infill results are hugely encouraging for a potential future underground mining operation at Two Mile Hill, which is currently being assessed by Brightstar and Entech for inclusion in the upcoming pre-feasibility study.

Prior to the recent discovery of the +300m-wide Shirvington Zone at depth, Two Mile Hill had already been identified as a potential large-scale underground mining operation, targeted to complement the proposed open pit mining in Sandstone.

These infill results validate that concept, illustrating both grade and scale. The infill drilling increases geological confidence, with the results to be incorporated into the next Mineral Resource Estimate update and pre-feasibility study, both targeted for release in November 2026.

Drilling continues at Sandstone, with two RC rigs at the Indomitable Camp (infill) and a growth-focused diamond rig drilling the exciting Shirvington Zone discovery at depth."

TECHNICAL DISCUSSION

TWO MILE HILL-SHILLINGTON DEPOSIT

The combined Two Mile Hill-Shillington deposit hosts a current MRE of **14.6Mt @ 1.6g/t Au for 731koz Au**. The bulk of the mineralisation is hosted within a steeply dipping tonalite intrusive stock, associated with pyrite and galena in thin quartz veins.

Recent drilling has highlighted a significant widening of the felsic intrusion at depth, from ~60-80m wide at 200m depth, to **>300m width at 700m depth**.

The June drilling program aimed to infill shallower areas of Two Mile Hill, in a part of the ore body where the tonalite is approximately 80m thick. This area has been highlighted as a possible future underground mining opportunity and is the subject of the pre-feasibility study. The drilling targeted increased confidence in order to facilitate a significant upgrade to Indicated classification in the next MRE update.

The program comprised **6 RC drill holes for ~1,500m** and **22 RC pre-collars with diamond tails (RCDT) for ~10,800m,** and **2 DD holes for ~300m**.

The drilling intersected significant widths of mineralised tonalite, with frequent visible gold (Figure 3), typically associated with pyrite and galena. Assays remain pending for 2 diamond tails totalling ~1,014m.

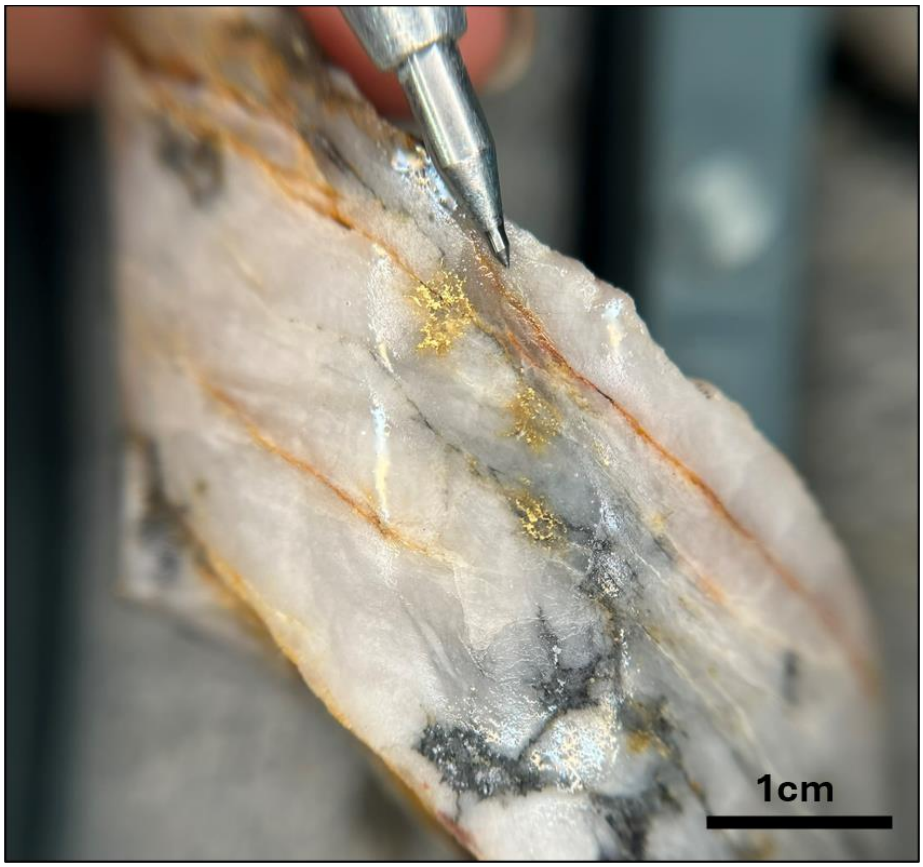

Figure 3: Example of visible gold observed in TMHRCD26006A drill core at 322.7m. Gold observed within quartz vein associated with galena and pyrite, within sericite-altered tonalite.
Contained within an intercept of 19m @ 24.3g/t from 306m, including 1m @ 449g/t from 322m.

Diamond tail assays have now been received for drill holes TMHRCD26004 and TMHRCD26006A within the tonalite producing bulk, unconstrained intercepts of:

- **225.7m @ 3.11g/t Au** from 284m in TMHRCD26006A
- **194m @ 2.10g/t Au** from 286m in TMHRCD26004

Results from the higher-grade intervals within the tonalite include:

TMHRCD26006A

- **19m @ 24.3g/t Au** from 306m, including **1m @ 449g/t Au** from 322m
- **1m @ 32.7g/t Au** from 329m
- **17m @ 1.12g/t Au** from 335m
- **4.9m @ 3.53g/t Au** from 440.4m
- **19.1m @ 2.76g/t Au** from 477m, including **0.8m @ 37.9g/t Au** from 477m

TMHRCD26004

- **32m @ 1.64g/t Au** from 286m
- **13m @ 4.35g/t Au** from 322m, including **0.8m @ 53.6g/t Au** from 324.2m
- **39.2m @ 1.22g/t Au** from 350m
- **13.3m @ 2.27g/t Au** from 392m, including **1m @ 18.1g/t Au** from 392m
- **0.6m @ 222g/t Au** from 432.5m
- **6m @ 5.54g/t Au** from 450m, including **1m @ 30.2g/t Au** from 451m
- **0.4m @ 66.9g/t Au** from 479.6m

ABOUT BRIGHTSTAR RESOURCES

Brightstar Resources Limited is an emerging gold producer listed on the Australian Securities Exchange (ASX: BTR) and based in Perth, WA.

The Company hosts a portfolio of high-quality assets located in the Tier-1 jurisdiction of Western Australia, with ~4.5Moz of Mineral Resources across the Goldfields and Sandstone regions, ideally located near key infrastructure such as sealed highways and on granted mining leases for ready development.

Brightstar is currently advancing the Goldfields Hub into near-term gold production, with a January 2026 updated Feasibility Study outlining the production of +75,000oz per annum for six years which delivered impressive financial metrics such as ~A$1 billion in LOM cashflows, a A$606 million NPV8 and 74% internal rate of return.

Construction of the 1.5Mtpa processing plant is underway and Brightstar is targeting commencement of gold production in June 2027.

Brightstar aspires to be a leading mid-tier gold miner via the staged development of its Goldfields Project and Sandstone Project, with current operations and proposed expansions providing a significant platform for growth.

NOTE:

- *Note some rounding discrepancies may occur. Tonnes are reported as thousand tonnes (Kt) and rounded to the nearest 1,000; Au ounces are reported as thousands rounded to the nearest 1,000.*
- *Pericles, Lady Shenton & Stirling deposits consolidated into 'Lady Shenton System' at Menzies.*
- *Warrior, Lady Harriet & Bellenger deposits consolidated into 'Lady Harriet System' at Menzies.*
- *Julias is located on M57/427, which is owned 75% by Brightstar and 25% by Estuary Resources Pty Ltd. Attributable gold ounces to Brightstar include 75% of total*
- *Mineral Resources are reported inclusive of Ore Reserves.*
- *The Mineral Resource estimates include Inferred Mineral Resources that are normally considered too speculative geologically to have economic considerations applied to them that would enable them to be categorised as Ore Reserves. There is also no certainty that Inferred Mineral Resources will be converted to Measured and Indicated categories through further drilling, or into Ore Reserves once economic considerations are applied.*
- *Mineral Resources are depleted for historical mining.*

Forward-Looking Statements

This document may include forward-looking statements. Forward-looking statements include, but are not limited to, statements concerning Brightstar Resources Limited's planned exploration program and other statements that are not historical facts. When used in this document, the words such as "could," "plan," "expect," "intend," "may", "potential," "should," and similar expressions are forward-looking statements. Although Brightstar believes that its expectations reflected in these forward-looking statements are reasonable, such statements involve risks and uncertainties and no assurance can be given that further exploration will result in the estimation of a Mineral Resource.

Competent Person Statement – Exploration

The information presented here relating to exploration of the Menzies, Laverton and Sandstone Gold Project areas is based on information compiled by Mr Michael Kammermann, MAIG. Mr Kammermann is a Member of the Australasian Institute of Geoscientists (AIG) and has sufficient experience relevant to the style of mineralisation and type of deposit under consideration and to the activity he is undertaking to qualify as a "Competent Person" as that term is defined in the 2012 Edition of the "Australasian Code of Reporting of Exploration Results, Mineral Resources and Ore Reserves (JORC Code 2012)". Mr Kammermann is a fulltime employee of the Company in the position of Exploration Manager and has provided written consent approving the inclusion of the Exploration Results in the form and context in which they appear.

Competent Person Statement – Mineral Resource Estimates

The information in the report to which this statement is attached that relates to Mineral Resources for the Sandstone deposits, excluding the Central Trend deposits, is based on information compiled or reviewed by Mr Graham de la Mare, a Competent Person who is a Fellow of the Australian Institute of Geoscientists. Graham de la Mare is a full-time employee of Brightstar Resources and has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Graham de la Mare consents to the inclusion in this announcement of statements based on this information in the form and context in which it appears.

This Announcement contains references to Brightstar's JORC Mineral Resource estimates, extracted from the ASX announcements titled "Aurumin to acquire 784,000oz Au Sandstone Gold Project" dated 15 December 2021, "Cork Tree Well Resource Upgrade Delivers 1Moz Group MRE" dated 23 June 2023, "Maiden Link Zone Mineral Resource" dated 15 November 2023, "Aspacia deposit records maiden Mineral Resource at the Menzies Gold Project" dated 17 April 2024, "Brightstar Makes Recommended Bid for Linden Gold", dated 25 March 2024, "Brightstar to drive consolidation of Sandstone Gold District" dated 1 August 2024, "Scheme Booklet Registered by ASIC" dated 14 October 2024, "Robust Mineral Resource Upgrades at Laverton and Menzies Underpins Future Mining Operations" dated 19 May 2025, "Menzies and Laverton Gold Projects Feasibility Study" dated 30 June 2025, "Brightstar pursues logical consolidation at Sandstone Hub" dated 21 July 2025, "Significant Growth in Menzies Mineral Resource" dated 11 December 2025, "Lord Byron MRE Update" dated 12 January 2026 and "Sandstone Mineral Resource Grows to 2.9Moz" dated 15 July 2026.

Brightstar confirms that it is not aware of any new information or data that materially affects the information included in the original market announcements and that all material assumptions and technical parameters underpinning the Mineral Resource estimates in the relevant market announcements continue to apply and have not materially changed. The

For personal use only

Company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcements.

Compliance Statement

With reference to previously reported Exploration Results and Mineral Resources, other than those identified in this announcement, the Company confirms that it is not aware of any new information or data that materially affects the information included in the original market announcement and, in the case of estimates of Mineral Resources that all material assumptions and technical parameters underpinning the estimates in the relevant market announcement continue to apply and have not materially changed. The company confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from the original market announcement.

For personal use only

APPENDIX 1: JORC CODE, 2012 EDITION – TABLE 1

SECTION 1 SAMPLING TECHNIQUES AND DATA

(Criteria in this section apply to all succeeding sections)

Criteria	JORC Code Explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	Drilling carried out by Brightstar Resources Ltd (TMHRCD prefixes) and Aurumin Limited (SN-TM prefixes) • Samples were collected by reverse circulation (RC) and diamond (DD) drilling. • RC samples were passed directly from the in-line cyclone through a rig mounted cone splitter. Samples were collected in 1m intervals into bulk plastic bags and 1m calico splits, which were retained for later use. • From the bulk 1m sample, a 4m composite sample was collected using a split PVC scoop and then submitted to Intertek Laboratory (Intertek) for analysis by Photon method. • RC 1m splits were submitted if the composite sample assay values are equal to or greater than 0.2g/t Au. • Diamond core sampling on HQ/NQ diamond drill core at mostly 1m intervals. Closer spaced sampling around specific mineralized zones or structures. Samples were submitted to Intertek for analysis by fire assay. Drilling carried out by Troy Resources NL (TRCD prefixes) • Troy Resources (TRY) RC drilling, samples were passed directly from the in-line cyclone through a rig mounted multi-tier riffle splitter. Samples were collected in 1m intervals into

personal use only

Criteria	JORC Code Explanation	Commentary
		bulk plastic bags and 1m calico splits. From the bulk sample, a 5m composite sample was collected using a split PVC scoop and then submitted to the laboratory for analysis. The 1m calico splits were submitted to the laboratory if the composite sample returned assay values equal to or greater than 0.2g/t Au. In certain cases selected samples from some holes were passed from the cyclone through a rig mounted multi-tier riffle splitter, and samples collected into calico bags at 1m intervals were submitted directly for analyses. The remaining bulk sample was placed on the ground in 1m intervals. • TRY diamond holes used triple tube coring due to the friable nature of the oxide zone lithologies being drilled. TRY core samples were marked on the core by the geologist according to geological intervals. The core was cut in half by TRY field technicians, with half being placed in a pre-numbered calico bag and the other half returned to the core tray. For duplicate samples the core to be submitted for analysis was quartered.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	• BTR RC drill holes were drilled utilising a 5.5 inch face sampling hammer and surveyed using true-North-seeking gyroscopic survey tools. Drilling was conducted by Topdrill, PXD and K-Drill using RC drill rig and support equipment suitable for the ground conditions and depth of drilling. • BTR Diamond drilling is drilled by Topdrill and Wallis Drilling using diamond drilling rigs and support equipment suitable for the ground conditions and depth of drilling. HQ and NQ diameter drill core was obtained. In areas of unconsolidated ground, triple tube configuration was used to maximise core

personal use only

Criteria	JORC Code Explanation	Commentary
		recovery. All drill core was oriented (where possible), using the Axis Champ Ori system. • AUN drilling used a KWL 350 drill rig with an onboard 1100cgm/350psi compressor and a truck mounted 1000cfm auxiliary and 1000psi booster. The face sampler had a nominal 140mm hole. • AUN diamond drilling is drilled by Terra Drilling. HQ and NQ diameter drill core was obtained. In areas of unconsolidated ground, triple tube configuration was used to maximise core recovery. All drill core was oriented (where possible). • TRY used Mt Magnet Drilling
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.*	• RC sample recovery for BTR samples was qualitatively assessed and recorded by comparing drill chip volumes (sample bags) for individual metres. Sample depths were cross-checked every rod (6m). The cyclone was regularly cleaned to ensure no material build up and sample material was checked for any potential downhole contamination. Wet samples were recorded, although the majority of samples were dry. In the CP's opinion, the drilling sample recoveries/quality are acceptable and are appropriately representative for the style of mineralisation • Sample recoveries are recorded on sample registers with sample recovery and moisture content estimated. Good sample recovery was standard in reported programs. • All samples are weighed at the laboratory and reported as a part of standard preparation protocols. No water compromised samples are reported in this program.

personal use only

Criteria	JORC Code Explanation	Commentary
		• Drilling is carried out orthogonal to the mineralisation to get representative samples of the mineralisation. • RC samples are collected through a cyclone and cone splitter. The sample required for the assay is collected directly into a calico sample bag at a designed 2kg sample mass which is optimal by Photon method. • BTR diamond core recoveries are recorded on sample registers and recorded as part of the logging procedure with core loss quantified. Good to moderate sample recovery was observed in reported programs with moderate core loss observed in structurally deformed areas (shear zones). • Short core runs were selected to maximise sample recovery, with core loss noted on core blocks within the core trays and subsequently checked by Brightstar personnel at the core farm. • No grade versus sample recovery biases, or biases relating the loss or gain or fines have been identified in the drilling.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	• BTR RC holes were logged on one metre intervals at the rig by the geologist from drill chips. Logging was recorded directly into Plexer logging software. • Diamond core is logged to specific geological intervals. • Detailed geological logging includes the lithology, alteration, veining and mineralisation of the drill chips or core. Structural measurements are also taken from oriented drill core. • Photographs are taken of all core as part of the sampling process.

personal use only

Criteria	JORC Code Explanation	Commentary
		• Geotechnical consultants logged selected core for geotechnical purposes. • Logging is both quantitative and qualitative in nature, depending on the feature. • 100% of BTR drilling is geologically logged. • AUN drill chips were sieved from each 1m sample and geologically logged. Washed drill chips from each 1m sample were stored in chip trays. Geological logging of drill hole intervals was carried out with sufficient detail to meet the requirements of resource estimation. • Troy drill holes were logged using detailed geological codes that were correlated with Alto/BTR logging codes and logging is of sufficient detail to meet the requirements of resource estimation.
Sub-sampling techniques and sample preparation	• *If core, whether cut or sawn and whether quarter, half or all core taken.* • *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	BTR RC drilling • RC drilling single 1 metre splits were automatically taken at the time of drilling by a cone splitter attached to the cyclone. • For interpreted non-mineralised areas, 4 metre composite samples were collected from the drill rig by spearing each 1m collection bag. The 4 metre composites were submitted for assay. • Composite samples returning grade >0.1g/t Au were resampled as 1m cone-split samples with samples having been collected for upcoming laboratory analyses. • For interpreted mineralised areas, the 1 metre splits were bagged on the static cyclone splitter on the RC rig.

personal use only

Criteria	JORC Code Explanation	Commentary
		• QAQC samples (blanks and standards) were submitted for all samples at a rate between 1:10 and 1:20 • Duplicate samples were taken over selected interpreted mineralised intervals to determine if sampling is representative. • Samples submitted for analysis via Photon assay technique were dried, crushed to nominal 85% passing 2mm, linear split and a nominal 500g sub sample taken. • The 500g sample is assayed for gold by Photon Assay along with quality control samples including certified reference materials, blanks and sample duplicates. • Samples volumes were typically 1.0-3.0 kg and are considered to be of suitable size for the style of mineralisation. BTR diamond drilling • QAQC samples (blanks and standards) were submitted for all samples at a rate between 1:10 and 1:25. • Duplicate samples were taken at a rate of 1:50. • Single cut (half core) diamond core was selected for sampling with the remaining core left for future reference and or metallurgical testwork purposes. • Sample preparation comprised industry standard oven drying, crushing, and pulverisation to less than 75 microns. Homogenised pulp material was used for assaying. • Internal certified laboratory QAQC is undertaken including check samples, blanks and internal standards.

personal use only

Criteria	JORC Code Explanation	Commentary
		• Samples volumes were typically 0.5kg-4.0 kg depending on the length of core sampled and are considered to be of suitable size for the style of mineralisation. AUN RC drilling • The 1m samples were collected from a cone splitter via the cyclone directly into pre-numbered calico bags, creating a nominal 2.5kg sample. • Composite samples were created using a PVC spear to collect sample from the reject 1m intervals placed on the ground. These were placed into pre-numbered calico bags. • All samples were submitted to ALS laboratories in Perth. Most samples were dry with some moisture present at depth in some holes. • Field Duplicate samples were taken as per Aurumin's QAQC sample procedure at a rate of 1:20. • Sample preparation for drill samples involved drying the whole sample before crushing and pulverising it to 85% passing 75 microns. A 50g sub-sample charge was then used for gold analysis by fire assay. • Samples where raw sample weight is greater than 3kg are fine crushed to 70% passing 2mm, then split using a Boyd Rotary Splitter to produce a 3kg sample which is then pulverised to 85% passing 75 microns. • QAQC samples were inserted in the field as per Aurumin's QAQC sample procedure. • Sample sizes are considered appropriate for the grain size of material sample.

personal use only

Criteria	JORC Code Explanation	Commentary
		AUN diamond drilling • AUN diamond drilling (DD) samples are HQ, HQ3 or NQ2 core with sample intervals defined by the geologist to honour geological boundaries, ranging from 0.3 to 1.2m in length. DD core was aligned and measured by tape, comparing back to down hole core blocks consistent with industry practice. Core was sampled as either half core in HQ core, or as whole core in NQ2 core. Where whole core was sampled a maximum sample length of 0.6m was adhered to so as to keep sample size around 3kg and minimise reduction insample volumes at larger particle sizes prior to pulverisation to 75 microns. • Core samples were submitted at intervals defined by the geologist for drying and pulverising to produce a nominal 50g charge for gold by fire assay analysis. Core sample width was decided with relation to the width of the geological/mineralised features. Through areas of uniform mineralisation or sheet work/stockwork type veining samples were taken at a uniform interval 0.6 to 1.0m intervals. Visible gold was occasionally encountered in core. Where visible gold was observed a flush was passed through the core saw and a barren flush inserted in the sample sequence. Core was consistently sampled from the same side. All core was photographed within each core tray. • AUN inserted CRM standards at a rate of 1:20 while blanks were inserted at 1:50. Duplicates were collected at 1:20 as per Aurumin QAQC procedures using the same method of collection as the original samples. QC samples were assessed on a batch by batch basis and no major issues were found.

personal use only

Criteria	JORC Code Explanation	Commentary
		Troy Resources NL drilling • RC samples were passed directly from a cyclone through a rig mounted multi-tier riffle splitter and samples were collected in 1m intervals into bulk plastic bags and 1m calico splits (which were retained for later use). • From the bulk sample, a 5m composite sample was collected using a split PVC scoop and then submitted to the laboratory for analysis. • The 1m calico splits were submitted to the laboratory if the composite sample returned assay values +1g/t Au over the anomalous zone. • Samples were collected Troy submitted 1 duplicate for every 50m of drilling. • TRY diamond holes used triple tube coring due to the friable nature of the oxide zone lithologies being drilled. TRY core samples were marked on the core by the geologist according to geological intervals. The core was cut in half by TRY field technicians, with half being placed in a pre-numbered calico bag and the other half returned to the core tray. For duplicate samples the core to be submitted for analysis was quartered. • TRY inserted a minimum of 1 CRM sample with each batch of samples for all exploration work. The actual standard used was dependant on the expected assay results and type of sample being taken (i.e. oxide, transitional or fresh rock). The grade of the standard used was also routinely varied. For RC and DD resource evaluation drilling an average of 1 field duplicate, 1 blank and 1 standard was submitted for every 50 samples. QC

personal use only

Criteria	JORC Code Explanation	Commentary
		samples were inserted randomly throughout the sample sequence. • TRY's exploration drilling results of QC samples were assessed by TRY on a batch by batch basis. Batches of samples where the results of the submitted standards differed from the expected value by more than 10% were re-analysed by the laboratory. A periodic audit of the exploration QC data was carried out by Data consultants Maxwell Geoservices (Maxwell). • TRY's Resource definition drilling results of QC standards were assessed by TRY on a batch by batch basis. Where results of the submitted standards differed from the expected value by more than 10% samples were re-analysed by the laboratory. TRY had independent checking of all QC sample results carried out by Maxwell on a monthly basis. Maxwell monitored the laboratory performance over longer period and liaised with the laboratory TRY when QC problems were detected. Maxwell reported that all standards and blanks fall within the expected limits. The field duplicate results had 20 to 25% of the repeat samples are outside of +/- 10% compared to the original sample values with no apparent bias. This is to be expected given the style of mineralisation.
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc.*	BTR Drilling • 1m and 4m RC composite, and diamond drilling samples were assayed via the Photon Assay method at Intertek laboratory, Perth. • Laboratory QC involves the use of internal lab standards,

personal use only

Criteria	JORC Code Explanation	Commentary
	• *Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.*	certified reference material, blanks, splits and replicates. QC results (blanks, coarse reject duplicates, bulk pulverised, standards) are monitored and were within acceptable limits. ~5-10% standards were inserted to check on precision of laboratory results. • Laboratory QC involves the use of internal lab standards, certified reference material, blanks, splits and replicates. QC results (blanks, coarse reject duplicates, bulk pulverised, standards) are monitored and were within acceptable limits. ~5% standards were inserted to check on precision of laboratory results. AUN drilling • All AUN RC samples were submitted to ALS Laboratories for sample preparation and analysis. A 50g sample was used to analyse gold by fire assay (AAS finish) with a 0.005 ppm detection limit. • The fire assay analysis undertaken is considered to be a total analysis method. • A fire assay fusion-gravimetric analysis is used for gold analysis in samples that return a greater than 100ppm results using the standard fire analysis technique. • Aurumin QAQC procedures collect field duplicates and insert certified reference materials (CRMs). Standards were inserted at a rate of 1:20 while blanks were inserted at 1:50. Duplicate samples are taken every 1:20. • Laboratory CRMs and repeats have been received and used to assess laboratory reproducibility and accuracy. • The assaying techniques and quality control protocols used are considered appropriate for the material tested and for the

personal use only

Criteria	JORC Code Explanation	Commentary
		data to be used for reporting exploration drilling results. • No geophysical tools were used in determining element concentrations. • AUN diamond samples were submitted to Intertek Laboratories in Maddington for sample preparation and analysed by fire assay with an ICP-OES finish. Single cut (half core) diamond core was selected for sampling with the remaining core left for future reference and or metallurgical testwork purposes. • Sample preparation comprised industry standard oven drying, crushing, and pulverisation to less than 75 microns. Homogenised pulp material was used for assaying. • Internal certified laboratory QAQC is undertaken including check samples, blanks and internal standards. • Samples volumes were typically 0.5kg-4.0 kg depending on the length of core sampled and are considered to be of suitable size for the style of mineralisation. Troy Resources NL • SGS Australia Pty Ltd (SGS) located in Perth, Western Australia were responsible for sample preparation and assaying for drill hole samples and associated check assays. SGS at the time was certified to the ISO 9001 requirements for all related inspection, verification, testing and certification activities. • RC samples were assayed using a 50g fire assay with AAS finish, and sample sizes were noted as being 2kg. Diamond core samples were dried and crushed, then split and a subsample pulverised to 95% passing 75 micron. This fraction was then split again to a 50g sample charge for FA/AAS. • An average of 1 field duplicate, 1 blank and 1 standard was

personal use only

Criteria	JORC Code Explanation	Commentary
		submitted for every 50 samples. • Troy engaged Maxwell to undertake periodic audit of the exploration QAQC data on a monthly basis. • Laboratory Repeat assays were reported for Troy drill assays
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	Brightstar Resources Ltd • Significant intersections have been reviewed by several company personnel. • Data storage was captured electronically onsite using Plexer logging software, before syncing to the cloud-based Plexer database • No data was adjusted. No transformations or alterations are made to assay data stored in the database. The lab's primary Au field is the one used for plotting purposes. No averaging of results for individual samples is employed. No top cuts are applied to the assays when calculating intercepts. Aurumin Limited • No independent verification of results has been conducted. • All sampling and assay data are stored in a secure database with restricted access. • Twinned holes are not considered necessary at this stage. • Field data were collected digitally into Excel spreadsheets at the time of logging. Logging data was validated by geological staff and then imported into the central Aurumin database. • All data is stored by geological data management consultancy Expedio and backed up to a cloud-based storage system. Troy Resources NL • Drilling carried out by Troy was compiled from WA Dept Mines

personal use only

Criteria	JORC Code Explanation	Commentary
		Open File records (WAMEX). • Data was transferred from WAMEX digital files to BTR database. The original WAMEX files were generally in excel or text format and were readily imported into BTR database.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	Brightstar Resources Limited • All drill collar locations were initially surveyed using a hand-held GPS, accurate to within 3-5m. • Post drilling, a qualified contract surveyor is engaged to pick up the hole collars with a RTK DGPS accurate to cm scale. • The grid system used is MGA94 Zone 50. All reported coordinates are referenced to this grid. • DH Surveys were measured during drilling using a north seeking gyro tool every 30m with a continuous survey at end of hole. Aurumin Limited • Drill collars were located using a GPS by Aurumin staff. A Differential GPSwas used to finalise hole locations. • The grid system used is MGA94 Zone 50. • DH Surveys were measured using a north seeking gyro tool every 30m with a continuous survey at end of hole. Troy Resources NL • Troy drilling was located with DGPS in AGD84 Zone 50. • No downhole survey data was reported; however it is considered unlikely that variation from the reported dip over the short drillhole lengths would be materially significant.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the*	• Holes are variably spaced with the intent of infilling hole spacings to a nominal pattern across the deposits.

personal use only

Criteria	JORC Code Explanation	Commentary
	degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. • *Whether sample compositing has been applied.*	• No sample compositing of field samples has been applied. • Spacing and distribution is sufficient to establish the degree of geological grade and continuity for a mineral resource estimation.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.*	• The relationship between the drilling orientation and the orientation of mineralised structures is not considered to have introduced a sampling bias. Most holes have been drilled perpendicular to the main orientation of mineralisation. • No drilling orientation related sampling bias has been identified at the project.
Sample security	• *The measures taken to ensure sample security.*	• BTR samples were collected on site under supervision of the geologist. Visitors needed permission to visit site. Once collected samples were bagged, they were transported to Perth by company personnel or trusted contractors for assaying with Intertek. Despatch and consignment notes were delivered and checked for discrepancies. • All samples collected by Aurumin were stored onsite in a secure location before being transported to Perth by consignment in sealed bags. • Troy reported that their drill samples were collected in a labelled and tied calico bag. Up to six calico bags were then placed in a larger polyweave bag that was labelled with the laboratory address and sender details and tied with wire. The polyweave bags were picked up by a courier firm who counted the number of polyweave bags before taking them to the Mt Magnet depot. The samples were picked up by the courier's road train and transported to Perth. Upon receipt of the samples the laboratory checked the sample IDs and total number of samples and notified Troy of any differences from the submission forms.

personal use only

Criteria	JORC Code Explanation	Commentary
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	• Sampling techniques and data have been reviewed internally by company personnel.

For personal use only

SECTION 2 REPORTING OF EXPLORATION RESULTS

Criteria	JORC Code Explanation	Commentary
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	The deposits are located within granted mining tenements; ○ Two Mile Hill-Shillington (M57/128) • All are granted tenements are owned by 100% subsidiary companies of Brightstar Resources Limited and are held in good standing with no known impediments.
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	• Modern exploration for gold in the Sandstone Greenstone Belt began with Western Mining Corporation (WMC) in the late 1970s through to the 1990s. WMC carried out 17 significant regional exploration programs and formed several joint ventures in the main Sandstone mines area and at Oroya, Hacks, and Bull Oak. After spending approximately $6M, WMC put its Sandstone assets out to tender, with Herald ultimately the successful bidder. • Herald carried out extensive exploration throughout the project area and carried out open pit mining at Bull Oak and Oroya. The Sandstone tenements were then sold to Troy Resources NL (Troy). • Troy undertook systematic exploration of the project area between 1998 and 2010, resulting in the discovery and subsequent mining of the Two Mile Hill, Bulchina, Lord Henry and Lord Nelson deposits. Troy ceased mining in August 2010 and the operations were placed on care and maintenance.
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The Sandstone Project covers much of the Sandstone Greenstone Belt, a triangular belt interpreted to be a north-plunging antiform situated at the northern end of the

Criteria	JORC Code Explanation	Commentary
		Southern Cross Domain. The belt primarily comprises mafic volcanic and intrusive units, with subordinate ultramafic, BIF and siliciclastic sediments. • Much of the residual greenstone belt regolith is overlain by depositional material including colluvium, sheet wash alluvium and aeolian deposits. The alluvium thins in the northern and eastern parts of the project area where underlying meta-sediments and granitoids are exposed at the surface. A lateritic horizon is observed across much of the belt. <u>Two Mile Hill-Shillington</u> • The mineralisation at Two Mile Hill is hosted in three geological domains. The majority of the Two Mile Hill resource occurs within a tonalite intrusion. • Mineralisation also occurs within banded iron formation (BIF) beds, and within the basalts that host the tonalite intrusion. • The tonalite intrusion is approximately oblate in plan, dipping ~78° towards 281°. Tonalite hosted mineralisation occurs predominantly as fine free gold within a sheeted/stockwork quartz vein array.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* • *easting and northing of the drill hole collar* • *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* • *dip and azimuth of the hole* • *down hole length and interception depth*	• The relevant data for drillholes reported in this announcement is provided in the body of the announcement. • Data for historical collars referenced in this announcement is provided in tables within the announcement.

Criteria	JORC Code Explanation	Commentary
	• *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	
Data aggregation methods	• *In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated.* • *Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.* • *The assumptions used for any reporting of metal equivalent values should be clearly stated.*	• Assay results reported here have been length weighted. • Significant intercepts are reported above 1.0g/t Au with a maximum consecutive interval of internal dilution (<1.0g/t Au) of 2m, unless otherwise stated. • No metal equivalent calculations were applied.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• True widths are not confirmed at this time although all drilling is planned perpendicular to interpreted strike of the target lodes at the time of drilling.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Refer to figures in this report.
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or*	• Results from all drill holes in the program have been reported at a consistent cut-off grade (>1.0g/t), and their context discussed.

personal use only

Criteria	JORC Code Explanation	Commentary
	widths should be practiced to avoid misleading reporting of Exploration Results.	
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• No other exploration data is reported here.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• Additional drilling is being planned and if successful, further mineral resource estimates will be estimated.

APPENDIX 2: Historical Hole Details: Two Mile Hill

Hole ID	Hole Type	Easting	Northing	RL	Azimuth	Dip	Hole Depth (m)		From (m)	To (m)	Drilled Interval (m)	Au (g/t)
