

tivan
a critical minerals company

asx announcement

7 September 2026

Bulk assay results materially advance Tivan's exploration model in Timor-Leste

- Further high-grade copper-gold mineralisation has been discovered at multiple target areas throughout Tivan's Baucau, Ossu and Turiscai Projects in the Democratic Republic of Timor-Leste.
- Grades of up to 6.87% Cu and 24.7g/t Au were returned from assays of 574 rock chips; anomalous nickel, cobalt and silver grades were also returned including up to 2.23% Ni, 0.26% Co and 15.1 g/t Ag.
- At the Vemassee Prospect (Baucau), a coherent Cu-Ag-Zn-S ± Se ± Bi geochemical trend has been identified over a 300m strike length including extensive copper and zinc anomalism.
- At the Scorpion Prospect (Baucau), a significant polymetallic anomaly has been identified extending over an area of approximately 1,000m by 800m, including high-grade copper, gold, nickel and cobalt mineralisation.
- Tivan is exploring for copper and gold mineralisation at its projects in Timor-Leste, including porphyry and volcanogenic massive sulphide ("VMS") style deposits.
- High-grade copper and gold mineralisation has previously been discovered at the projects through rock chip and stream sediment sampling; a large-scale regional drone magnetic survey is underway at the Turiscai and Baucau Projects to identify and refine priority exploration targets for drilling.
- The latest assay results further support Tivan's exploration model in Timor-Leste and highlight the prospectivity of the Projects for high-grade mineralisation of critical minerals and precious metals.

The Board of Tivan Limited (ASX: TVN) ("Tivan" or the "Company") is pleased to advise that the Company has received bulk assay results from its ongoing surface sampling programs at the Baucau, Ossu and Turiscai Projects ("Projects") in Democratic Republic of Timor-Leste, returning high-grade copper-gold mineralisation at multiple prospects. Assay results from 574 rock chip samples across the Projects (see Figure 1 below) have returned high-grade copper of up to 6.87% Cu and gold of up to 24.7g/t Au. In addition, anomalous grades of cobalt and nickel, up to 2.23% Ni and 0.26% Co, were also returned from the sampling conducted by Tivan.

The latest assay results further support Tivan's exploration model in Timor-Leste and highlight the prospectivity of the Projects for high-grade copper-gold mineralisation. The results have also validated two copper-gold prospects at the Baucau project, Vemassee and Scorpion, which will be a priority focus for Tivan's geology team in designing a maiden drilling campaign, scheduled for Q4 2026.

The latest assay results have also supported definition of the Vemassee Prospect, following the discovery of extensive copper and zinc mineralisation across a significant area. A coherent Cu-Ag-Zn-S ± Se ± Bi geochemical trend with 13 anomalous samples collected over a 300m strike length trend has been identified. The results reinforce Tivan's geological interpretation of Vemassee and its prior selection as a priority target area for the Company's recently commenced high-resolution UAV magnetic survey (see ASX announcement dated 27 August 2026).

At the Scorpion Prospect, sampling has identified a significant polymetallic anomaly extending over an area of approximately 1,000m by 800m. The scale and multi-element nature of the results have established Scorpion as a priority prospect for follow-up exploration, with work now focused on advancing and prioritising drill targets for first-pass drilling.

Timor-Leste remains significantly underexplored with very limited historical exploration undertaken. The geological setting hosts some of the world's most significant copper-gold deposits including Grasberg (Central Papua, Indonesia), Ok Tedi (Papua New Guinea), Wafi-Golpu (Papua New Guinea) and Panguna (Bougainville, Papua New Guinea).

Tivan is focused on defining initial high-quality copper-gold priority targets for drilling at the Projects. As previously announced, the Company has commenced a large-scale unmanned aerial vehicle ("UAV") drone magnetic survey across priority target zones within the Turiscai and Baucau Projects, covering ~57km² of prospective ground and generating high-definition magnetic, LiDAR and photogrammetric data (see ASX announcement of 27 August 2026).

Figure 1: Location map showing assays reported and pending across Baucau, Ossu and Turiscai Projects

Sampling Program & Assay Results

A total of 574 assay results has been returned from the latest phase of rock chip sampling across the Projects, representing a significant increase in the volume of geochemical data available across the Timor-Leste portfolio.

Historically, samples collected from the Projects were exported to Australia for geochemical analysis. This process involved extended logistical timeframes associated with international freight, import and quarantine requirements, irradiation of samples and laboratory turnaround times.

Tivan has subsequently transitioned its Timor-Leste assay workflow to Intertek Laboratories in Jakarta, Indonesia, providing a substantially more efficient pathway for the shipment and analysis of samples from Timor-Leste. The revised workflow has significantly improved assay turnaround times and the rate at which analytical data is returned to Tivan's geology team, enabling results to be progressively incorporated into the Company's evolving exploration model in a more timely manner to inform the planning and prioritisation of ongoing exploration activities.

Tivan's understanding of the geology and mineralisation across its Timor-Leste project portfolio has advanced significantly as a result of the substantial volume of new geochemical data generated through the exploration program. Importantly, the results are enabling Tivan to distinguish between different styles of mineralisation and their associated geochemical signatures, providing a stronger basis for prospect definition and exploration targeting.

This is particularly evident at the Vemassee and Scorpion Prospects at Baucau Project, that have emerged as priority prospects with distinct geochemical signatures and geological settings. The recognition of these contrasting mineralisation styles demonstrates the broader polymetallic prospectivity of the Baucau Project and provides Tivan with an increasingly refined framework to prioritise follow-up exploration and advance the strongest opportunities toward drill-target definition.

Sampling methods and techniques are described in the JORC Code, 2012 Edition: Table 1 Report enclosed with this announcement. A full list of results is provided in Appendix A.

Baucau Project

The Baucau Project is located ~123km east of the capital of Timor-Leste, Dili, comprises three granted Exploration and Evaluation Licenses, nearby Tivan's forward operating exploration compound located in Ro-Ulo, Bahu, within the Municipality of Baucau.

Tivan has executed a Binding Term Sheet with Iron Fortune Pty Ltd granting Tivan an option to acquire 100% of an additional Exploration and Evaluation License located to the immediate west of the Baucau Project (see ASX announcement of 20 August 2026) (see Figure 1). The close proximity of Tivan's exploration program to the western boundary of the Company's existing Baucau concessions can be seen in Figure 2.

Tivan has executed a Binding Term Sheet with state-owned mining company Murak Rai Timor E.P. for the establishment of a joint venture in relation to the Baucau Project (see ASX announcement of 22 May 2026), facilitating a practical platform for technical collaboration and local participation in the long-term development of Timor-Leste's mineral sector.

Previous rock chip sampling undertaken by Tivan at the Baucau Project had returned assay results of up to 0.76% Cu and 9.3 g/t Au, consistent with the samples collected by prior project owner Beacon Minerals, who returned assay results from rock chip sampling of up to 4.18% Cu, 37.8 g/t Au and 1.12% Co (see ASX announcement of 10 April 2026).

Latest Assay Results – Baucau Project

At the Baucau Project, a total of 331 rock chip samples were collected, returning assay results of up to 6.87% Cu, 24.70 g/t Au and 2.68% Co, reinforcing previous results and providing further evidence of widespread high-grade copper-gold mineralisation across the project. The results have validated two copper-gold prospects at the Baucau project, Scorpion and Vemassee, now a priority focus for the Company (see Figure 2 below).

Figure 2: Assay results for samples at Baucau, showing location of the Scorpion and Vemassee Prospects

Vemassee Prospect

Within the Baucau Project, exploration activities have identified the Vemassee Prospect as a priority area for follow-up exploration, based on the results of recent rock-chip sampling and its prospective geological setting.

The Vemassee Prospect is located within the Maubisse Formation. The Maubisse formation is a geological sequence comprising of volcanic, volcanoclastic, carbonaceous shale and carbonate rocks that may provide a favourable setting for hydrothermal mineralisation. 47 rock chip samples were collected at the Vemassee Prospect over a 3km x 3km area. Samples were taken of basalt, serpentinite, carbonaceous shale and limestone rocks.

Rock-chip sampling at Vemassee has identified a coherent Cu-Ag-Zn-S ± Se ± Bi geochemical trend with 13 anomalous samples collected over a 300m strike length trend. The coincident copper, zinc, silver and sulphur geochemical response is considered indicative of a sulphide bearing hydrothermal system. The accompanying selenium and bismuth provides additional support for a potentially magmatic hydrothermal or volcanic-hosted mineral system.

The spatial coherence alongside the geological setting provides justification for follow up exploration. Further geological mapping, rock chip sampling and ridge and spur sampling will be undertaken to further define the geometry and controls of mineralisation and assess the potential for volcanic-hosted massive sulphide (VMS) - style or structurally controlled Cu-Ag-Zn mineralisation.

Figure 3: Multi-element geochemical plots for rock-chip samples collected at the Vemassee Prospect at Baucau, showing Cu, Ag, Zn, S, Se and Bi assay results

Scorpion Prospect

At the Scorpion Prospect, recent exploration has identified a significant polymetallic geochemical anomaly, providing a new priority area for follow-up exploration. The Scorpion Prospect is located within the Bobonaro Scaly Clay, a regionally extensive tectonic mélangé formed during the collision between the Australian continental margin and the Banda Arc. The unit comprises a highly deformed clay-rich matrix containing exotic blocks of sedimentary, volcanic, metamorphic and ultramafic lithologies.

A total of 70 rock chip samples were collected across the Scorpion Prospect and surrounding area, targeting exposed serpentinite, basalt, sandstone and chert lithologies. Sampling has identified a significant polymetallic geochemical anomaly with characteristics consistent with a potential mafic-ultramafic-associated Ni-Cu-Co system. Strongly anomalous Ni, Cu, Co, Cr and Mg, supported by the presence of serpentinite, indicates a strong ultramafic component. The additional association of Au, Ag, Te, Se and S indicates a significant sulphide and hydrothermal overprint. The anomalous geochemistry defines a zone approximately 1,000m by 800m in extent.

Figure 5: Multi-element geochemical plots for rock-chip samples collected at the Scorpion Prospect at Baucau, showing Cu, Ag, Zn, S, Se and Bi assay results

Figure 6: Assay results and the Scorpion Prospect at Baucau showing expanded footprint, with all samples greater than 0.1% Cu labelled

The geochemical signature at Scorpion suggests that ultramafic lithologies incorporated within the Bobonaro Scaly Clay have been locally overprinted by hydrothermal alteration and mineralisation. The particularly strong association of Ni-Cu-Co with Au-Ag $\pm$ Te-Se suggests that hydrothermal fluids interacted with and modified the original ultramafic geochemical signature, potentially remobilising and concentrating metals along structural zones, lithological contacts and the margins of competent exotic blocks.

Tivan considers the Bobonaro Scaly Clay to be a highly prospective exploration environment due to its intense tectonic deformation and incorporation of exotic blocks derived from a range of older geological formations, including mafic and ultramafic rocks. These lithologies provide favourable sources and potential hosts for polymetallic mineralisation, with comparable mafic and ultramafic-associated mineralisation recognised elsewhere in Timor.

At Scorpion, the key exploration opportunity is to delineate competent ultramafic and mafic blocks, structural corridors and lithological contacts within the mélange that may have acted as conduits and traps for hydrothermal fluids and associated metal deposition.

Ossu Project

The Ossu Project is located ~123km east of Dili and comprises three granted Exploration and Evaluation Licenses (see Figure 1). Tivan has executed a Binding Term Sheet with state-owned mining company Murak Rai Timor E.P. for the establishment of a joint venture in relation to the Ossu Project (see ASX announcement of 22 May 2026).

Previous rock chip sampling undertaken by Tivan at the Ossu Project has returned assay results of up to 17.4% Cu, 38.1 g/t Au and 0.45% Co, consistent with the samples collected by prior project owner Beacon Minerals, who returned assay results from rock chip sampling of up to 14.6% Cu, 10.1 g/t Au and 0.94% Co (see ASX announcement of 10 April 2026).

Latest Assay Results –Ossu Project

At the Ossu Project, a total of 211 rock chip samples were collected, returning assay results of up to 2.5% Cu and 7.26 g/t Au. Sampling included the high-priority Ossu Bridge Prospect.

The Ossu Bridge Prospect is located within the Bobonaro Scaly Clay. Similarly to the Scorpion Prospect at Baucau, there is extensive serpentinite and limestone at surface. Sampling was focussed on extending known mineralisation from previously reported samples of up to 17.4% Cu.

94 rock chip samples were collected at the Ossu Bridge Prospect and surrounds. Samples returned a maximum of 7.26ppm Au and 2.5% Cu. Ossu exhibits a broadly similar geochemical response to the Scorpion Prospect, with anomalous samples characterised by elevated base metals and pathfinder elements indicative of a mafic/ultramafic host rocks (Ni, Cu, Co, Cr and Mg) with potential overprinting hydrothermal alteration and/or sulphide mineralisation (Au-Ag $\pm$ Te-Se). However, the geochemical response at Ossu is more discontinuous relative to Scorpion, with anomalous samples occurring as isolated clusters separated by areas of unmineralised limestone. Tivan is prioritising further geological mapping and targeted rock chip sampling to better understand the mineralisation at the Ossu Bridge Prospect.

tivan
a critical minerals company

asx announcement

Figure 7: Assay results from the Ossu Bridge Prospect showing expanded footprint, with all samples greater than 0.1% Cu labelled

Turiscail Project

The Turiscail Project is a copper-gold exploration project located approximately 40km south of Timor-Leste's capital of Dili. The project covers an area of 344km² across seven contiguous Exploration and Evaluation Licences. The Licences span three municipalities: Manufahi, Ainaro and Manatuto, and benefit from existing transportation routes that make travel between areas of interest efficient.

Tivan's in-country geology team has completed extensive programs of mapping and rock chip sampling across the Turiscail Project, returning assays grading up to 23.1% Cu and 7.19g/t Au, and also grades of up to 6.17% Zn. Anomalous grades of up to 35.7 ppm Ag, 1.86 ppm Bi, and 281 ppm Se have also been returned from rock chip sampling. Silver, bismuth and selenium are considered key pathfinder elements commonly associated with porphyry style mineral systems. See ASX announcements of 14 November 2025, 27 January 2026 and 27 May 2026 for further details.

Tivan has also completed a regional scale stream sediment sampling at the Turiscail Project, returning grades of up to 434 ppm Cu and 0.801 ppm Au. The grades returned are considered significant for stream sediment sampling against

established background and anomalous threshold values within the project area. Anomalous grades of up to 0.20 ppm Ag, 0.62 ppm Bi and 2.60 ppm Se were also returned from the program, again considered key pathfinder elements associated with porphyry style deposits. See ASX announcement of 27 May 2026 for further details.

Latest Assay Results – Turiscai Project

At the Turiscai Project, a total of 32 rock chip samples were collected, returning assay results of up to 0.58% Cu and 0.02 g/t Au. The results provide additional geochemical information across the Project, which remains highly prospective for Cu-Au mineralisation. The recently commenced high-resolution UAV magnetic survey will provide an important new dataset to refine the geological and structural interpretation of Turiscai and prioritise areas for follow-up exploration.

Figure 8: Assay results from the Turiscai showing expanded footprint, with all samples greater than 0.1% Cu labelled

Next Steps

Tivan is continuing to deepen the Company's commitments in Timor-Leste, including through the regular presence of Executive Chairman, Mr Grant Wilson, and Special Advisor, Major Michael Stone (Ret'd). The Board of Tivan views the opportunities in Timor-Leste as unique within South East Asia and central to the corporate mission of the Company.

Tivan's local team is rapidly expanding and fully integrated with the Company's geology and technical functions, providing strong in-country capability to support the next phase of development.

Tivan will next integrate results from the latest sampling program with geological mapping and, where applicable, high-resolution UAV magnetic, LiDAR and photogrammetric data as they become available to refine its exploration model and prioritise targets across its Timor-Leste project portfolio.

Follow-up exploration will initially focus on the Vemassee and Scorpion Prospects at the Baucau Project. At Vemassee, further geological mapping and geochemical sampling will seek to define the extent and controls of the geochemical trend identified through recent sampling. At Scorpion, follow-up work will focus on defining the extent and continuity of mineralisation and its geological and structural controls.

At the Ossu Project, geological mapping and geochemical sampling will continue to refine areas of interest.

At the Turiscai Project, existing and ongoing exploration results will be integrated with data from the current UAV survey to refine geological and structural interpretations and identify priority targets.

The next phase of exploration will focus on defining and prioritising targets for first-pass drilling at the Baucau and Ossu Projects in Q4 2026, while working toward drill-target opportunities at the Turiscai Project planned for Q2 2027, once the monsoonal season has passed.

Comment from Tivan Executive Chairman

Mr Grant Wilson commented:

"Our report today illustrates the material progress Tivan is making in Timor-Leste and the steep knowledge curve we are ascending, transforming world-class prospectivity into actionable drilling targets, all with the strong support of local stakeholders and the Government of Timor-Leste.

My congratulations to our geology team in Australia, for their professionalism in advancing our projects methodically and systematically over the past year and a half, and to our local team for their hard work and dedication in the field, including their respectful engagement with the communities where we are operating.

Since the start of Tivan we have highlighted the importance of creating a durable alignment of interests between stakeholders and shareholders. In Timor-Leste, we are firmly on track to deliver maiden drilling programs that have the potential to transform Timor-Leste as a nation, and to generate unbounded upside for shareholders of Tivan.

This announcement has been approved by the Board of the Company.

Forward Looking Statement

This announcement contains certain "forward-looking statements" and comments about future matters. Forward-looking statements can generally be identified by the use of forward-looking words such as, "expect", "anticipate", "likely", "intend", "should", "estimate", "target", "outlook", and other similar expressions and include, but are not limited to, the timing, outcome and effects of exploration, test work, future studies, project development and other work. Indications of, and guidance or outlook on, test results, future earnings, financial position, performance of the Company or global markets for relevant commodities are also forward-looking statements. You are cautioned not to place undue reliance on forward-looking statements. Any such statements, opinions and estimates in this announcement speak only as of the date hereof, are preliminary views and are based on assumptions and contingencies subject to change without notice. Forward-looking statements are provided as a general guide only. There can be no assurance that actual outcomes will not differ materially from these forward-looking statements. Any such forward looking statement also inherently involves known and unknown risks, uncertainties and other factors and may involve significant elements of subjective judgement and assumptions that may cause actual results, performance and achievements to differ. Except as required by law the Company undertakes no obligation to finalise, check, supplement, revise or update forward-looking statements in the future, regardless of whether new information, future events or results or other factors affect the information contained in this announcement.

Competent Person's Statement

Tivan's exploration activities for the Turiscai, Baucau and Ossu Projects are being overseen by Mr Stephen Walsh (BSc). The information that relates to exploration results in this announcement is based on and fairly represents information and supporting documentation prepared and compiled by Mr Walsh, a Competent Person, who is the Chief Geologist and an employee of Tivan, and a member of the Australasian Institute of Mining and Metallurgy (AusIMM). Mr Walsh has sufficient experience of relevance to the styles of mineralisation and the types of deposits under consideration, and to the activities undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Joint Ore Reserves Committee (JORC) Australasian Code for Reporting of Exploration Results. Mr Walsh consents to the inclusion in this announcement of the matters based on information compiled by him in the form and context which it appears.

Exploration Results

The information in this announcement that relates to exploration results for the Turiscai Project has been extracted from the Company's previous ASX announcements entitled:

- "Tivan discovers high-grade copper-gold mineralisation at Turiscai Project in Timor-Leste" dated 14 November 2025.
- "Further copper-gold mineralisation discovered at Turiscai Project" dated 27 January 2026.
- "Regional scale stream sediment sampling returns highly anomalous copper-gold results at Turiscai Project in Timor-Leste" dated 27 May 2026.

The information in this announcement that relates to exploration results for the Baucau and Ossu Projects has been extracted from the Company's previous ASX announcement entitled:

- "Tivan locates high-grade copper-gold mineralisation at Baucau and Ossu Projects in Timor-Leste" dated 10 April 2026.
- "Tivan commences drone surveys in Timor-Leste" dated 27 August 2026.

Copies of the announcements are available at www.asx.com.au or www.tivan.com.au/investors/asx-announcements. The Company confirms that it is not aware of any new information or data that materially affects the information included in those announcements. Tivan confirms that the form and context in which the Competent Person's findings are presented have not been materially modified from those announcements.

Table 1 – Tivan assays results returned from surface sampling program

JORC Code, 2012 Edition: Table 1 Report

SECTION 1 SAMPLING TECHNIQUES AND DATA		
Criteria	JORC Code explanation	Commentary
Sampling techniques	- Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. - Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used. - Aspects of the determination of mineralisation that are Material to the Public Report. - In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.	- Rock chip and grab samples were taken from numerous locations throughout Licence areas. - Sampling methodology was primarily rock chip and grab sampling of visible outcrop. The nature of this sampling method does not constrain grade across significant areas. - This type of first pass rock chip sampling is considered standard and appropriate for assessing prospective areas. The laboratory methods are appropriate.
Drilling techniques	Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).	No drilling is reported in this release.
Drill sample recovery	- Method of recording and assessing core and chip sample recoveries and results assessed. - Measures taken to maximise sample recovery and ensure representative nature of the samples. - Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	No drilling is reported in this release.
Logging	- Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies. - Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography. - The total length and percentage of the relevant intersections logged.	- No drilling is reported in this release. - Logging of rock chip samples record lithology, mineralogy, mineralisation, structures, textures, and other noticeable features.
Sub-sampling techniques and sample preparation	- If core, whether cut or sawn and whether quarter, half or all core taken. - If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry. - For all sample types, the nature, quality and appropriateness of the sample preparation technique. - Quality control procedures adopted for all sub-sampling stages to maximize representivity of samples. - Measures taken to ensure that the sampling is representative of the in situ material collected,	- Tivan collected Samples were sent to Intertek Minerals Jakarta Indonesia for laboratory analysis. Sample preparation comprised of an industry standard of drying, jaw crushing and pulverising to -75 microns (85% passing). Samples are dried, crushed and pulverized to produce a homogenous representative sub-sample for analysis. - Laboratory QC procedures for rock sample assays involve the use of laboratory certified reference material, blanks and duplicates.

	- including for instance results for field duplicate/second-half sampling. - Whether sample sizes are appropriate to the grain size of the material being sampled.	- Representative sampling/measurements are not necessary for this stage of exploration. - The size of the rock chip samples is appropriate for this stage of exploration (~1-2kg)
Quality of assay data and laboratory tests	- The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total. - For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. - Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.	- Tivan samples were sent to Intertek Minerals Jakarta Indonesia for analysis. - Tivan samples are pulverized to 95% passing 75 microns. A multi element suite is analyzed using four acid digestion ICP-OES/MS finish. Fire assay for gold analysis is used (50g charge weight). - Standards, blanks and repeats were used as standard practices Global following standard QAQC protocols. - For samples that showed overlimit readings, ore-grade/over-range assays methods were used.
Verification of sampling and assaying	- The verification of significant intersections by either independent or alternative company personnel. - The use of twinned holes. - Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols. - Discuss any adjustment to assay data.	- No drilling is reported in this release. - Primary field data is recorded on an Android Tablet using QField app. Coordinates are cross-checked with a hand-held GPS data. - Tivan primary data stored in MX Deposit, with data importers used import data into the database (both field data and assay data). Copies of all data also stored on the company SharePoint for the project.
Location of data points	- Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation. - Specification of the grid system used. - Quality and adequacy of topographic control.	- For Tivan samples, a Garmin GPSMAP 67i multi frequency GPS was used to pick up locations of samples with an accuracy of 1m to 3m. - The grid system used is WGS 84 / UTM Zone 51s and WGS 84 / UTM Zone 52s.
Data spacing and distribution	- Data spacing for reporting of Exploration Results. - Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. - Whether sample compositing has been applied.	- Rock chip sampling is applicable to this level of reconnaissance of this work - No mineral resource or reserve calculation have been applied. - No sample compositing has been applied.
Orientation of data in relation to geological structure	- Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type. - If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.	- Sampling was conducted at visible outcropping units and focused on areas expressing notable variation, alteration, or mineralisation. - Sampling was conducted along the rivers where outcrop is prominent. - Sampling was conducted along rivers where float material was present and sampled where float expressed notable variation, alteration, or mineralization.
Sample security	The measures taken to ensure sample security.	Tivan samples are placed into labelled calico bags and transported in a 4WD vehicle. Samples were air freighted from Dili, Timor-Leste to Jakarta, Indonesia using a door-to-door courier. All sample submissions are documented with results reported via email.
Audits or reviews	The results of any audits or reviews of sampling techniques and data.	Sampling and data methodologies and practices are regularly reviewed internally. To date, no external audits have been completed on this project.

SECTION 2 REPORTING OF EXPLORATION RESULTS

Criteria	JORC Code explanation	Commentary																												
Mineral tenement and land tenure status	- Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. - The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.	<table><tr><th>Concession Area</th><th>Licence Number</th></tr><tr><td>MEL2023-CA-ZB-003</td><td>LPP/2024/008</td></tr><tr><td>MEL2023-CA-ZB-004</td><td>LPP/2024/009</td></tr><tr><td>MEL2023-CA-ZB-005</td><td>LPP/2024/010</td></tr><tr><td>MEL2023-CA-ZB-006</td><td>LPP/2024/011</td></tr><tr><td>MEL2023-CA-ZB-007</td><td>LPP/2024/012</td></tr><tr><td>MEL2023-CA-ZB-008</td><td>LPP/2024/013</td></tr><tr><td>MEL2025-DA-ZC-002</td><td>LPP/2025/005</td></tr><tr><td>MEL2025-DA-ZC-003</td><td>LPP/2025/006</td></tr><tr><td>MEL2025-DA-ZC-004</td><td>LPP/2025/007</td></tr><tr><td>MEL2025-DA-ZC-005</td><td>LPP/2025/008</td></tr><tr><td>MEL2025-DA-ZC-006</td><td>LPP/2025/009</td></tr><tr><td>MEL2025-DA-ZC-007</td><td>LPP/2025/010</td></tr><tr><td>MEL2025-DA-ZC-008</td><td>LPP/2025/011</td></tr></table> Licenses are owned 100% and held by Tivan's wholly owned subsidiary Aitutu Pty Ltd, RP. Exploration done by other parties	Acknowledgment and appraisal of exploration by other parties.	<u>Baucau and Ossu Projects</u> - Beacon Minerals Ltd (BCN) has been exploring in Timor Leste since 2016. They were awarded the 6 mineral concession listed above in April 2024 with the inaugural issuance of mineral exploration concessions across Timor-Leste. - BCN ASX announcement on 17 April 2024 confirmed Cu, Au and Co mineralization in 6 rock chip samples. - Beacon continued early stage exploration of the concession areas until late 2025. Exploration activities included rock chip sampling, channel sampling, stream sediment sampling and soil sampling. They also conducted some ground magnetic geophysical surveys. <u>Turiscail Project</u> - Report titled Exploration of Portuguese Timor by Allied Mining Consultants to Asia Investment Company Limited (1937) describes regional mapping of the area along with observations of artisanal mining in the Sue, Cler and South Lacro Rivers. The report mentions rock chip samples of veins were taken for assay, however no sample location data or assay results are available.																												
Geology	Deposit type, geological setting, and style of mineralisation.	<u>Baucau and Ossu Projects</u> See the body of the report. <u>Turiscail Project</u> Geological description sourced from Allied Mining Consultants report (1937). The Manufahi district consists of black and grey metamorphic shales and slates in the southern areas and meta igneous rocks in the northern area. Slates can contain lenses of iron and copper sulfides, with some thick quartz lenses containing iron sulphides with some mica. Three vein types were																												

Drill hole Information	- A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes: - easting and northing of the drill hole collar - elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar - dip and azimuth of the hole - down hole length and interception depth - hole length. - If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.	observed in the northern meta igneous rocks, with all veins considered gold bearing. Vein groups are Quartz veins (sometimes gold bearing), Quartz-Calcite veins (with disseminated pyrite and copper pyrites) and calcite veins (with pyrite). No drilling is reported in this release.
Data aggregation methods	- In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high grades) and cut-off grades are usually Material and should be stated. - Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail. - The assumptions used for any reporting of metal equivalent values should be clearly stated.	Not applicable, no grade inferences made.
Relationship between mineralisation widths and intercept lengths	- These relationships are particularly important in the reporting of Exploration Results. - If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported. - If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').	Not applicable, no drilling reported in this release.
Diagrams	Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.	Refer to Figures in the body of the text.
Balanced reporting	Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.	See the body of the report.
Other substantive exploration data	Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.	All relevant data is included in the body of the announcement.

tivan
a critical minerals company

asx announcement

Further work

- *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).*
- *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*
- See body of report
- See figures in body of report
