SANDY MITCHELL PROJECT MINERAL RESOURCE ESTIMATE INCREASES 428%

379.4Mt at 5,430ppm MzEq, with 97% in the Measured and Indicated categories

HIGHLIGHTS

- Updated JORC (2012) Mineral Resource Estimate for the Sandy Mitchell Rare Earth Elements and Heavy Minerals Project of **379.4Mt @ 5,430ppm** Monazite Equivalent (MzEq), comprising:
  - Measured: **73.2Mt @ 4,990ppm MzEq**
  - Indicated: **296.4Mt @ 5,570ppm MzEq**
  - Inferred: **9.8Mt @ 4,630ppm MzEq**

  reported at a 1,957ppm MzEq lower cut-off grade
- Measured and Indicated Resources total **369.6Mt @ 5,460ppm MzEq**, representing 97% of the total estimate by tonnage
- Total Heavy Minerals of **3.0%** and Total Commercial Minerals of **16.2%** equating to approximately **11.6Mt of contained heavy minerals** and **61.4Mt of contained commercial minerals** (in-situ; no metallurgical recovery applied)
- Represents a **428% (307.6Mt) increase in tonnes** over the October 2024 Measured MRE of 71.8Mt @ 1,730ppm MzEq – the grades are not directly comparable as the MzEq formula and cut-off grade have been reset (see *Comparison with previous Mineral Resource Estimate*)
- On the Company's review of publicly reported estimates, Sandy Mitchell is the **largest rare earth Mineral Resource reported under the JORC Code (2012) hosted in a residual heavy mineral sand derived from a metamorphic basement complex** (see *Deposit style and basis of comparison*)
- Updated MRE incorporates the Stage 1, Stage 2 and Stage 3 resource drilling programs, with the interpreted mineralised domain grown from 4.05km^2 to 23.3km^2 – approximately 14% of the 169km^2 EPM 28013 – across the 100%-held Mining Lease ML 100409 and EPM 28013
- Estimated in-situ contained minerals of approximately **508,000t monazite**, **527,000t monazite plus xenotime**, **140,000t TREO+Y** and **254,000t zircon** (in-situ; no metallurgical recovery applied)
- High-value basket of heavy and industrial minerals, with total grades: Monazite 1,340ppm, Xenotime 50ppm, Zircon 670ppm; Titanium minerals – Rutile 80ppm, high-Ti Leucoxene 240ppm, low-Ti Leucoxene 150ppm, Altered Ilmenite 250ppm and Ilmenite 270ppm; and Garnet 2.7%, with muscovite (1.1%) and biotite (12.0%) mica as potential co-products
- Magnetic rare earth oxides (Nd, Pr, Dy, Tb) average 90ppm, or approximately **26% of the TREO basket**
- Mineralisation extends from surface to an average sand depth of approximately 11 metres, amenable to low-cost, free-dig, open-pit mining methods
- Substantial growth potential remains across EPM 28013, with the MRE to feed into an updated Scoping Study and subsequent Pre-Feasibility Study, alongside the IHC Mining metallurgical test work program

For personal use only

Table 1: Updated Sandy Mitchell Mineral Resource Estimate by classification at a 1,957ppm MzEq lower cut-off grade.

Classification	Tonnes (Mt)	MzEq (ppm)	THM (%)	TREO+Y (ppm)	Monazite (ppm)
Measured	73.2	4,990	2.6	430	1,310
Indicated	296.4	5,570	3.2	360	1,360
Inferred	9.8	4,630	2.4	370	930
Total	**379.4**	**5,430**	**3.0**	**370**	**1,340**

THM = total heavy minerals (monazite, xenotime, zircon, rutile, high- and low-Ti leucoxene, altered ilmenite, ilmenite and garnet). TREO+Y = total rare earth oxides plus yttrium oxide. Mineral Resources are reported inclusive of all classifications and are not additive to any Ore Reserve, as no Ore Reserve has been estimated for the Project. Figures are rounded and may not sum precisely.

Ark Mines Limited (ASX: AHK) ('AHK' or the **'Company')** is pleased to announce a substantially expanded Mineral Resource Estimate (**MRE**) for its 100%-owned Sandy Mitchell Rare Earth Elements and Heavy Minerals Project in North Queensland, approximately 230 kilometres north-west of Cairns.

The updated MRE incorporates the results of the Company's Stage 1, Stage 2 and Stage 3 resource drilling programs and totals 379.4 million tonnes at 5,430ppm MzEq, comprising a Measured Resource of 73.2Mt, an Indicated Resource of 296.4Mt and an Inferred Resource of 9.8Mt. Measured and Indicated material accounts for 97% of the estimate by tonnage.

***Managing Director Ben Emery said**: "This updated Mineral Resource Estimate transforms the scale of Sandy Mitchell, making it, to our knowledge, the largest rare earth resource reported under the JORC Code (2012) hosted in a residual heavy mineral sand derived from a metamorphic basement complex. Three stages of resource drilling have increased the defined resource by 428% from 71.8Mt to 379.4Mt, with almost all of it now sitting in the Measured and Indicated categories. That is the foundation a Pre-Feasibility Study needs."*

"Just as importantly, the mineralisation has proved to be remarkably consistent. Grades logged and assayed from surface, right across an area that has grown from four square kilometres to more than 23, sit within a narrow range. And there is substantial room to grow further – the current resource footprint covers only around 14% of our 169km^2 tenure. A shallow, flat-lying, free-digging deposit of this size and consistency is straightforward to plan around, and we look forward to seeing this reflected in the updated Scoping Study."

RESOURCE DRILLING

The updated MRE is informed by the Company's Stage 1 (2023), Stage 2 (2023) and Stage 3 (2025) resource definition drilling programs, together with and Stage 2 reconnaissance drilling that falls within the estimation domain. Historic and contemporary auger drilling has been excluded from the estimation.

The Stage 3 resource expansion program, completed by drill contractor Australian Exploration Drilling (AED), comprised 218 productive vertical holes for 2,330.5 metres across 18 drill lines, using air core drilling through the sand column with a reverse circulation face hammer finish to complete the bedrock intercept metre. Holes were drilled to an average depth of approximately 10.7 metres, with heavy mineral sands logged from surface to metamorphic bedrock in every hole and an average sand depth of approximately 10.0 metres (refer ASX announcement 20 August 2026).

Stage 3 was drilled on a 280 metre by 280 metre staggered grid abutting the northern and eastern edges of the Stage 1 and Stage 2 drilling that informed the maiden Measured Resource. That spacing was determined by sensitivity analysis of the variography underpinning the maiden estimate, in order to yield a data density capable of supporting a predominant confidence level of Indicated. The drilling extends beyond the boundary of Mining Lease ML 100409 into EPM 28013, taking the total resource drilling footprint to 2,328.5 hectares.

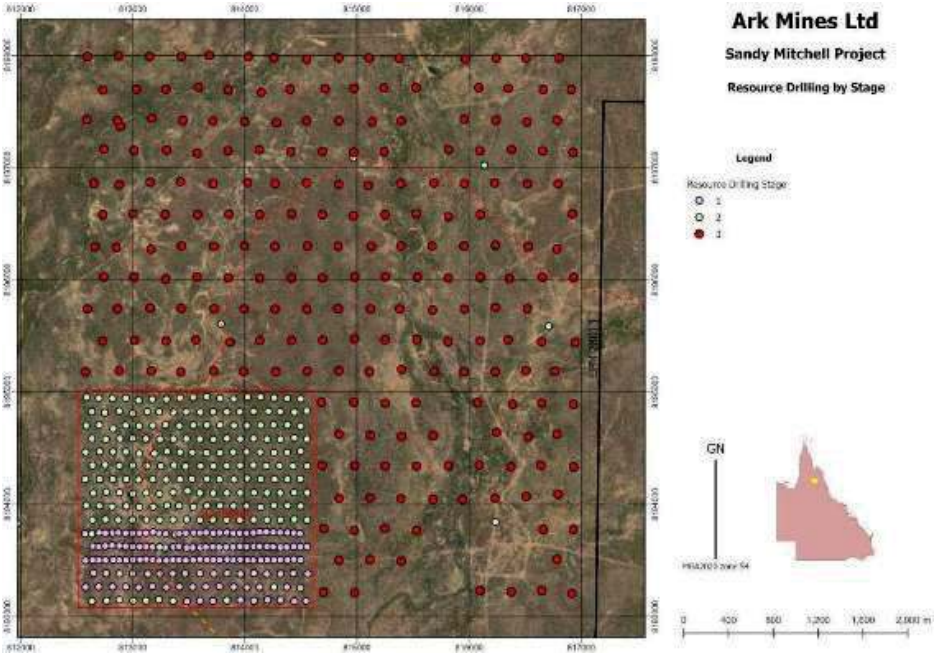

Figure 2: Sandy Mitchell resource drilling by stage. Stage 3 collars shown in red.

For personal use only

The mineral sand domain encompassing the combined three stages of resource drilling, wireframed from the RTK-surveyed topographic surface to the bedrock intersection with a 50% drill spacing interpolation limit, has a volume of 240.6 million cubic metres. That volume excludes a 426,306 cubic metre zone of unmineralised lithology near the south-western corner, within the existing MRE volume, corresponding to a lithological change modelled in the maiden estimate. The wireframe is snapped to the collar at surface and to the bedrock intercept for each drill hole; all intervening surface points are RTK survey pickups by qualified surveyor Twine Surveys, accurate to 20mm in x and y and 200mm in z.

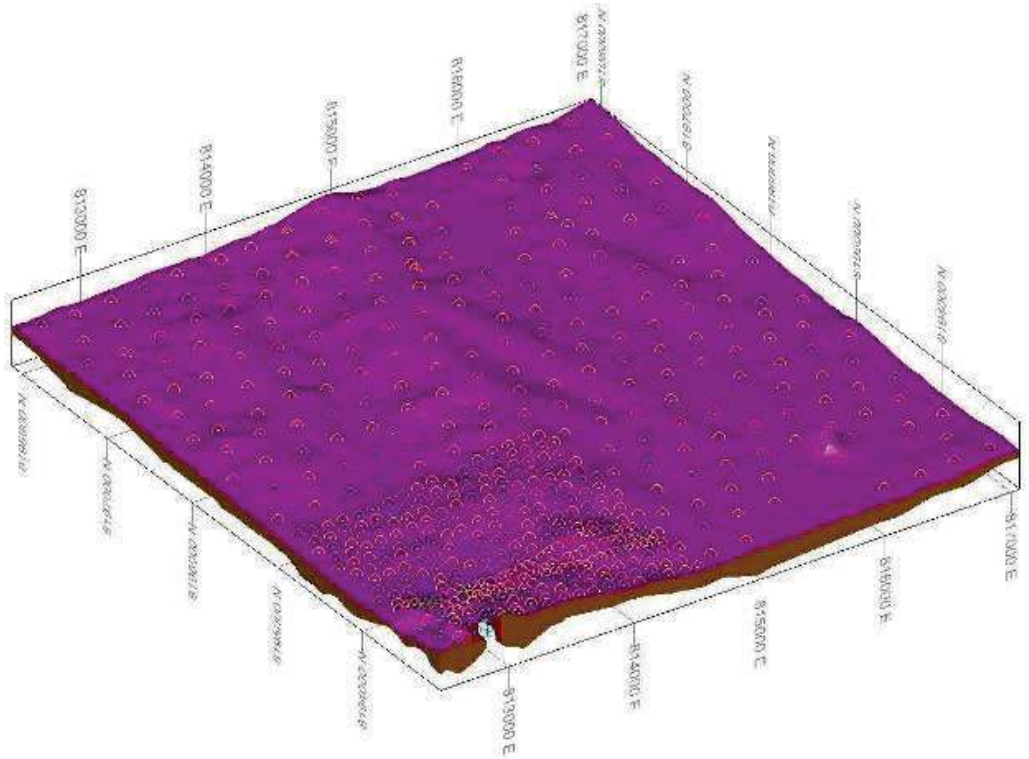

Figure 3: Mineral sand domain wireframe looking north-east, shown at 10x vertical exaggeration with drill collars marked by circles.

One-metre samples were collected across the full sand column and submitted to NATA-accredited Jinning Test and Inspection in Western Australia for multi-element analysis by sodium peroxide fusion with ICP-MS finish, and four-acid digest with ICP-OES or ICP-MS finish as appropriate for the element. Quality control comprised field duplicates at 1 in 40, certified reference standards at 1 in 14, laboratory repeats at 1 in 12 and blanks at 1 in 40, with all raw analytical data independently reviewed by a chartered analytical chemist. Full details are set out in the JORC Code (2012) Table 1 Section 2 Appendix 5.

Table 2: Drilling informing the updated Mineral Resource Estimate.

Program	Year	Holes	Metres	Average depth (m)	Average sand depth (m)
Historic auger (exploration)	2012	101	~500	~5	~5
Stage 1 air core (resource)	2023	144	1,488.3	10.3	10.3
Stage 2 AC/RC (resource)	2023	185	2,427.1	13.0	12.2
Stage 2 AC/RC (reconnaissance)	2023	32	393.0	12.3	11.3
Stage 3 AC/RC (resource)	2025	218	2,330.5	10.7	10.0

Source: HGS Australia, Sandy Mitchell Resource Evaluation Report, August 2026. The 2025 program is designated Stage 3 in the Company's ASX reporting; it is designated Stage 4 in the HGS report, which numbers the December 2023 auger reconnaissance grid separately as Stage 3. Stage 3 comprised 220 collars for 2,334.8 metres, including two failed stubs totalling 4.3 metres, leaving 218 productive holes for 2,330.5 metres.

STAGE 3 DOWN-HOLE ASSAY RESULTS

Assays returned rare earth element, heavy mineral and industrial mineral values in every metre sampled across the Stage 3 program, consistent with the values returned from the Stage 1 and Stage 2 drilling that informed the maiden Measured MRE. Length-weighted down-hole averages for the principal minerals are set out in Table 3 and plotted in Figures 4 to 10 (refer ASX announcement 20 August 2026). Full tabulated data for every hole by the metre is set out in that announcement.

Table 3: Stage 3 length-weighted down-hole averages, compared with all resource drilling stages combined.

Mineral or mineral group	Stage 3 average	Stage 3 maximum	All stages average	All stages maximum
Total heavy minerals (THM)	3.5%	–	3.03%	–
Total commercial minerals (TCM)	16.9%	–	15.5%	–
Monazite plus xenotime	1,413.5ppm	–	1,379.8ppm	–
TREO plus yttrium	361.5ppm	1,433.6ppm	411.7ppm	19,297.9ppm
Zircon	658.7ppm	4,534.5ppm	671.4ppm	10,825.9ppm
Mineral sand depth	10.0m	25m	10.8m	30m

Values are length-weighted down-hole averages per hole. THM comprises monazite, xenotime, zircon, rutile, leucoxene, altered ilmenite, ilmenite and garnet. TCM comprises THM plus muscovite and biotite. These are Exploration Results and are not Mineral Resources; the Mineral Resource Estimate is reported in Tables 1 and 5 to 7.

Stage 3 drilling extends beyond the boundary of the 100%-held Mining Lease ML 100409 into EPM 28013. The area covered by the previous Measured MRE and ML 100409 is 404.1 hectares. Stage 3 drilling covers a further 1,924.4 hectares, for total resource drilling coverage of 2,328.5 hectares.

GEOLOGY AND MINERALISATION

The Project lies over the southern extent of the Yambo Inlier, west of the Palmerville Fault System. EPM 28013 is underlain in its eastern two-thirds by the Palaeo- to Mesoproterozoic Chelmsford Gneiss, a sillimanite-biotite-garnet gneiss of upper amphibolite to granulite grade, with the western third underlain by the early Devonian Lukinville Granodiorite of the Kintore Supersuite.

For personal use only

For personal use only

Rare earth and heavy mineral mineralisation occurs in the fine to very fine sand fraction of a polymictic, unconsolidated sediment package that is largely devoid of clay through cyclical tropical weathering and drainage. The sands are interpreted to have formed in situ by weathering-driven disaggregation of the underlying Chelmsford Gneiss, supported by pervasive angular monazite and xenotime clasts, coarse muscovite and biotite books, locally derived polymictic clasts, an absence of sorting, and only slightly lower grades where drilling penetrates the gneiss itself. Grades are relatively evenly distributed with respect to profile depth, with no substantial lag enrichment at surface or gravity settling at the base of the profile. The entire sand horizon and the top of the underlying bedrock are fully oxidised.

The mineralised domain is flat-lying and sheet-like, surfacing or near-surfacing and extending to an average depth of approximately 11 metres, with local thicknesses in excess of 20 metres.

Deposit style and basis of comparison

Sandy Mitchell is a residual heavy mineral sand deposit. The sand and its contained rare earth minerals were generated in place by weathering-driven disaggregation of the metamorphic basement immediately beneath them, and have not been transported and hydraulically sorted into a placer. The Competent Person's evidence for this, set out above, includes pervasive angular clasts of monazite and xenotime, coarse and well-crystallised biotite books, locally derived polymictic clasts of Chelmsford lithologies, the absence of grain sorting through the profile, and grades in the underlying gneiss only slightly lower than in the overlying sands.

This distinguishes the deposit from the two rare earth deposit styles it is most often compared with. Transported placer and alluvial deposits — beach and dune mineral sands, and alluvial outwash fans — concentrate detrital monazite and xenotime by hydraulic sorting, and their grade distribution reflects that sorting. Ionic adsorption clay deposits host rare earths adsorbed onto clay minerals and require a leaching circuit to recover them. Sandy Mitchell is neither. Its profile is largely free of clay, with very little secondary clay developed and surficial clays in the uppermost metre interpreted as transported wet season flood wash, and its rare earths occur as discrete mineral grains recoverable by conventional wet gravity and spiral beneficiation. A fine fraction is present: approximately 9% of the as-received ore reports to the minus 45 micron ultrafine fraction, and work is continuing on recovery of monazite from that stream, as described under Metallurgy below.

On the Company's review of publicly reported MREs, Sandy Mitchell is the largest rare earth Mineral Resource reported under the JORC Code (2012) that is hosted in a residual heavy mineral sand derived from a metamorphic basement complex.

Basis of comparison. This statement is a comparison with Mineral Resource estimates publicly reported by other entities. It is based on a review of publicly available Mineral Resource statements reported under the JORC Code (2012) as at the date of this announcement, limited to deposits described by their reporting entity as residual or in-situ heavy mineral sands developed on a metamorphic basement. Estimates reported under other reporting codes, transported placer and alluvial sand deposits, ionic adsorption clay deposits, and hard rock, carbonatite and phosphate-hosted deposits are excluded from the comparison. The Company has no interest in, and does not warrant the accuracy of, the estimates of other entities referred to in that review, and investors should not assume that the comparison is a measure of the relative economic value of the deposits compared.

ESTIMATION METHODOLOGY

The updated MRE was prepared by independent consultants HGS Australia in accordance with the JORC Code (2012). A mineralised outline prepared by Ark was validated by HGS and used to flag and composite sample data to one-metre intervals. Thirty-one elements were extracted for statistical analysis and interpolated independently into the block model.

A block model was constructed in Surpac (version 6.6.2 x64) over the interval 8,193,000mN to 8,198,200mN, 812,300mE to 817,400mE and 115mRL to 205mRL on MGA2020 Zone 54. Parent cells are 50 metres north by 25 metres east by 2 metres vertical, with sub-celling to a minimum of 12.5 metres by 6.25 metres by 0.5 metres, for a total of 1,507,629 blocks. Block size, search distance and sample numbers were determined by kriging efficiency and conditional bias slope optimisation on yttrium at both close-spaced and broad-spaced locations.

For personal use only

Grades were estimated by ordinary kriging using variographically derived search parameters, with an inverse-distance-squared model estimated in parallel for validation. Interpolation used three passes: 20–200 samples within a 200-metre search, 10–200 samples within 400 metres, and 1–200 samples within 800 metres to fill a small number of residual edge blocks. Top-cuts were applied to 28 of the 31 elements to control statistical outliers, determined from histograms and probability plots; holmium, thulium and lutetium required no cutting. Top-cut statistics are set out in Section 2.

Bulk density was interpolated into the model by nearest neighbour from 1,893 gravimetric dry loose bulk density measurements, ranging from 0.48 to 2.41 t/m³ and averaging 1.53 t/m³.

Mineral species were calculated in the block model from the estimated elemental grades using stoichiometric formulae and elemental deportments to mineral species measured by quantitative automated mineralogy (QEMSCAN) conducted by ALS, supported by laser ablation ICP-MS mineral grain assays by CODES Analytical Laboratories. The methodology and calculations have been reviewed by Empirical Earth Science, HGS Australia and MZ Minerals. Calculated mineral fields comprise monazite, xenotime, zircon, rutile, high-and low-Ti leucoxene, altered ilmenite and ilmenite (reported in ppm), and garnet, muscovite, biotite, THM and TCM (reported in per cent), together with TREO, TREO+Y, LREO, HREO, CREO, MagREO and MzEq (reported in ppm)

The model was validated by trend analysis plots comparing composited drill sample grades with interpolated block grades on regular sections for scandium, terbium, dysprosium, holmium, erbium, thulium and ytterbium, and by visual section-by-section comparison of block grades against drill grades for cerium and neodymium. All comparisons were considered acceptable.

MONAZITE EQUIVALENT (MzEq)

Monazite Equivalent is a mineral equivalent grade that expresses the combined contribution of the valuable minerals in the assemblage as a single figure. MzEq is considered the appropriate reporting basis for Sandy Mitchell because the intended product is a mineral concentrate for shipment, so a mineral-weighted equivalent is more representative of the deposit than any single element or oxide. The equation applied is:

MzEq (ppm) = (1.000 × monazite ppm + 1.000 × xenotime ppm + 0.361 × zircon ppm + 0.281 × rutile ppm + 0.165 × high-Ti leucoxene ppm + 0.126 × low-Ti leucoxene ppm + 0.072 × altered ilmenite ppm + 0.065 × ilmenite ppm) + (0.058 × garnet % + 0.026 × muscovite % + 0.015 × biotite %) × 10,000

Each factor is the ratio of the assigned value of that mineral to the assigned value of monazite. Assigned values are based on long-term average prices and do not represent current market values; the factor is intended to capture the value differential between minerals rather than absolute value, and is currency independent because any conversion applies to both numerator and denominator. Only the recoverable portion of the valuable elements is attributed to each mineral, by QEMSCAN-measured elemental deportment. The individual mineral grades contributing to MzEq are reported in Tables 5 to 7.

Table 4: Monazite Equivalent factors and price assumptions by mineral.

Mineral	Product specification	Assigned value (A$/t)	Factor
Monazite	–	9,001.77	1.000
Xenotime	–	9,001.77	1.000
Zircon	–	3,251.91	0.361
Rutile	TiO_2 > 95%	2,527.86	0.281
High-Ti leucoxene	TiO_2 > 85%	1,482.31	0.165
Low-Ti leucoxene	TiO_2 > 70%	1,134.90	0.126
Altered ilmenite	TiO_2 > 55%	645.48	0.072
Ilmenite	TiO_2 > 50%	584.41	0.065
Garnet	–	519.85	0.058

Mineral	Product specification	Assigned value (A$/t)	Factor
Muscovite	–	237.65	0.026
Biotite	–	133.68	0.015

The Monazite Equivalent represents an equivalence of minerals in the ground. It does not incorporate metallurgical recovery or heavy mineral separation performance, as would be required in an Ore Reserve estimate. Metallurgical recovery assumptions are discussed under "Metallurgy" below.

The Competent Person's opinion is that all elements and minerals included in the Monazite Equivalent calculation have a reasonable potential to be recovered and sold.

MINERAL RESOURCE ESTIMATE

The Sandy Mitchell Mineral Resource is reported at a 1,957ppm MzEq lower cut-off grade. The estimate and the reported grades for each modelled mineral and mineral group are set out in Tables 5 to 7.

Table 5: Rare earth mineral and oxide grades by classification at a 1,957ppm MzEq lower cut-off.

Classification	Tonnes (Mt)	MzEq (ppm)	Monazite (ppm)	Xenotime (ppm)	CREO (ppm)	MagREO (ppm)	TREO (ppm)	TREO+Y (ppm)
Measured	73.2	4,990	1,310	50	110	100	400	430
Indicated	296.4	5,570	1,360	50	100	80	330	360
Inferred	9.8	4,630	930	40	100	90	340	370
Total	**379.4**	**5,430**	**1,340**	**50**	**100**	**90**	**340**	**370**

CREO = critical rare earth oxides (Y, Nd, Eu, Tb, Dy). MagREO = magnet rare earth oxides (Pr, Nd, Tb, Dy). TREO = total rare earth oxides. Figures are rounded and may not sum precisely.

Table 6: Zircon, titanium and industrial mineral grades by classification at a 1,957ppm MzEq lower cut-off.

Classification	Zircon (ppm)	Rutile (ppm)	Hi-Ti leucoxene (ppm)	Lo-Ti leucoxene (ppm)	Alt. ilmenite (ppm)	Ilmenite (ppm)
Measured	660	80	220	140	230	250
Indicated	670	80	240	150	250	270
Inferred	660	80	240	150	250	270
Total	**670**	**80**	**240**	**150**	**250**	**270**

Table 7: Garnet, mica and total mineral content by classification at a 1,957ppm MzEq lower cut-off.

Classification	Garnet (%)	Muscovite (%)	Biotite (%)	THM (%)	TCM (%)
Measured	2.3	1.2	10.9	2.6	14.7
Indicated	2.9	1.1	12.3	3.2	16.6
Inferred	2.2	1.1	11.7	2.4	15.2
Total	**2.7**	**1.1**	**12.0**	**3.0**	**16.2**

THM = total heavy minerals (monazite, xenotime, zircon, rutile, high- and low-Ti leucoxene, altered ilmenite, ilmenite and garnet). TCM = total commercial minerals (THM plus muscovite and biotite).

Full elemental grade tabulation for the individual rare earth and trace elements, including scandium, thorium, uranium, niobium, hafnium, arsenic and sulphur, is set out in Section 2.

CUT-OFF GRADE AND REASONABLE PROSPECTS FOR EVENTUAL ECONOMIC EXTRACTION

The 1,957ppm MzEq lower cut-off grade reflects the extended mineral suite now included in the MzEq calculation. It was determined by statistical analysis to isolate the mixed population in the left tail of the grade distribution and truncate the low-grade tail, while honouring the interpreted geology and acting as an effective discriminator. The spatial correlation between the previously applied 700ppm MzEq cut-off and the 1,957ppm MzEq cut-off is exact: the new cut-off yields the same geologically validated domain constraints as the old one on the old MzEq basis.

In forming the view that the estimate has reasonable prospects for eventual economic extraction, the Competent Person has had regard to: mineralisation that surfaces or near-surfaces and extends to an average depth of approximately 11 metres, supporting free-dig open-pit mining with a negligible strip ratio; an unconsolidated, clay-poor sand host requiring no drilling and blasting and no primary crushing; metallurgical test work indicating that a saleable heavy mineral concentrate can be produced by conventional wet gravity separation without full-stream grinding; a multi-product mineral assemblage with established end-use markets; and the granted tenure and access position described below. No mining, processing, infrastructure, capital or operating cost study has been completed to a level that would support an Ore Reserve, and no Ore Reserve has been estimated.

METALLURGY

Test work by Mineral Technologies at its Carrara laboratory produced a final concentrate grading 51.9% TREO, with direct CeO_2 recovery from gravity feed to concentrate estimated at 71.7%, and an indicated overall recovery of up to 83.8% once intermediate streams that would normally be recycled in continuous operation are accounted for.

Quantitative automated mineralogical analysis by ALS on two size fractions of a +2.85 SG composite feed confirmed that cerium, lanthanum and neodymium are hosted principally by monazite, yttrium by xenotime, and zirconium and hafnium exclusively by zircon.

A scoping-level metallurgical program conducted by IHC Mining in 2025 examined the characterisation of run-of-mine material and preliminary process options. Phase 1 results indicated that crushing the +2mm oversize fraction to a 2mm top size lifts TREO distribution into the heavy mineral fraction to 48.4% on head feed and 71.6% on the deslimed sandy fraction, and ZrO_2 distribution to 54.5% and 67.2% respectively; that attrition scrubbing ahead of wet gravity concentration is not required; that the +0.5mm heavy mineral fraction is a well-liberated potential garnet source; and that garnet, monazite and zircon in the finer fractions are well liberated below 0.25mm. Multi-gravity separation of finer fractions and wet high-gradient magnetic separation for monazite recovery from slimes have been recommended for assessment in Phase 2.

The Competent Person considers that the metallurgical assumptions underpinning the Mineral Resource Estimate remain reasonable. Further test work will be used to refine metallurgical factors in subsequent resource updates and studies. The IHC Mining Phase 2 report was not available at the date of the resource evaluation report.

CLASSIFICATION

Classification has been applied in accordance with the JORC Code (2012) guidelines. Measured classification has been applied in the close-spaced south-western area drilled at 100 metres by 100 metres or closer. Indicated classification has been applied across the remainder of the estimation domain. Inferred classification has been applied to one small area in the central south-east of the domain where drilling could not be conducted because of pastoral access constraints. The Company is planning further drilling to increase confidence in that

area in a future program.

In arriving at these classifications, the Competent Person has had regard to the consistency of mineralisation and grade continuity demonstrated across three drill grid patterns (100 metres by 50 metres, 100 metres by 100 metres staggered and 280 metres by 280 metres staggered), the quality of the drilling and assay quality assurance and quality control, collar survey by qualified surveyor using RTK differential GPS, strong recognition of geological controls on mineralisation, grade variability sufficient to produce robust variograms, the level of metallurgical understanding, and the shallow, simple nature of the mineralisation.

COMPARISON WITH PREVIOUS MINERAL RESOURCE ESTIMATE

The previous Sandy Mitchell MRE, reported on 2 October 2024, comprised 71.8Mt at 1,730ppm MzEq in the Measured category, reported at a 700ppm MzEq lower cut-off grade. The reported grades in the two estimates are not directly comparable, for two reasons.

First, the MzEq formula has changed. The October 2024 formula combined eight heavy minerals: monazite, xenotime, zircon, rutile, high- and low-Ti leucoxene, altered ilmenite and ilmenite. The updated formula adds garnet, muscovite and biotite, following the addition of iron, manganese, magnesium and aluminium to the assay suite and the stoichiometric calculation of those three minerals. As biotite alone averages 12.0% and garnet 2.7%, the extended formula produces a materially higher MzEq value for the same rock.

Second, and consequentially, the lower cut-off grade has been reset from 700ppm to 1,957ppm MzEq. The Competent Person has determined that the two cut-offs are spatially equivalent on their respective MzEq bases and constrain the same geologically validated domain.

The increase in tonnage is attributable to the Stage 3 drilling, which expanded the interpreted mineralised domain from 4.05km² to 23.3km². The Measured category is broadly unchanged in tonnage (71.8Mt to 73.2Mt), with the growth in the newly defined Indicated category.

Table 8: Comparison of the October 2024 and August 2026 Mineral Resource Estimates.

Parameter	October 2024 MRE	August 2026 MRE
MzEq basis	8 minerals	11 minerals (adds garnet, muscovite, biotite)
Lower cut-off grade	700ppm MzEq	1,957ppm MzEq
Classification	Measured	Measured, Indicated and Inferred
Measured tonnes	71.8Mt	73.2Mt
Indicated tonnes	Nil	296.4Mt
Inferred tonnes	Nil	9.8Mt
Total tonnes	71.8Mt	379.4Mt
Reported MzEq grade	1,730ppm	5,430ppm
Interpreted domain area	4.05km²	23.3km²
Estimation method	Ordinary kriging	Ordinary kriging

EXPLORATION TARGET

The Company's previously reported Exploration Target for the Sandy Mitchell Project is in the range of 1,320Mt to 1,580Mt at a grade range of 1,290ppm to 1,900ppm MzEq (refer ASX announcement 6 November 2024).

For personal use only

Table 9: Sandy Mitchell JORC (2012) Exploration Target.

	Tonnage	Grade
Lower bound	1,320Mt	1,290ppm MzEq
Upper bound	1,580Mt	1,900ppm MzEq

The potential quantity and grade of the Exploration Target is conceptual in nature. There has been insufficient exploration to estimate a Mineral Resource, and it is uncertain whether further exploration will result in the estimation of a Mineral Resource.

Basis of the Exploration Target

The Exploration Target is based on reconnaissance drill hole coverage across the prospective area of the tenement, the interpreted thickness and lateral extent of the mineral sand sheet, the grade population derived from reconnaissance assays, and the tonnage and grade assumptions used to derive the upper and lower bounds of the reported ranges. The reconnaissance drilling on which it relies comprises the Stage 2 reconnaissance program of 32 air core and reverse circulation holes for 393 metres, together with the Stage 3 auger exploration grid. These were drilled at wide spacing to cover as much of the tenement as possible, with hole distribution controlled by rig access along existing tracks and fence lines.

The Competent Person considers the auger reconnaissance data to be of good quality for exploration purposes, but below resource confidence standards because the drill type involves outside sample return with attendant contamination potential, equivalent to a rotary air blast sample. Examination of the data shows none of the patterns or biases typical of significant up-hole contamination.

Relationship to the updated Mineral Resource Estimate

The Exploration Target was estimated on the previous eight-mineral MzEq basis and, when reported, was in addition to and did not include the then-current Mineral Resource of 71.8Mt. The Stage 3 drilling that informs this updated Mineral Resource Estimate was carried out within the area to which the Exploration Target relates, and has expanded the interpreted mineralised domain from 4.05km² to 23.3km².

Accordingly, a substantial part of the previously reported Exploration Target has now been converted to Mineral Resources. The previously reported Exploration Target should no longer be read as being additional in full to the updated MRE, and the grade ranges are not directly comparable with the MzEq grades reported in this announcement because of the change in the MzEq basis described above. The Company will restate the Exploration Target, on the revised MzEq basis and net of the updated MRE, in a subsequent announcement.

The updated MRE represents only part of the previously reported Exploration Target, and the Company considers there is substantial scope for further Mineral Resource growth within EPM 28013, which covers 169km² against a current resource drilling footprint of 23.3km². As such, any growth is subject to the cautionary statement above.

TENURE AND MATERIAL INFORMATION

The Mineral Resource is located within the 100%-held Mining Lease ML 100409 and Exploration Permit for Minerals EPM 28013. EPM 28013 was granted on 22 August 2022 and expires on 21 August 2027. The Company is not aware of any impediment to the renewal of that tenure. ML 100409 was granted on 12 March 2026 with an expiry date of 31 March 2036. Company is not aware of any impediment to the renewal of that tenure.

ML 100409 covers 4.04 ha and is covered by granted Environmental Authority P-EA-100805234 for environmentally relevant activity: non-scheduled mining activity. To date an ecological scoping assessment has been completed, a ground water infiltration study has been completed, a ground water monitoring and testing programme has been designed and implemented, and an environmental impact assessment covering the resource, potential infrastructure and future expansion area is currently in the scoping phase. A cultural heritage survey covering the resource area has been completed and an expanded survey covering future expansion potential and infrastructure potential is schedule for later this year.

For personal use only

The estimate includes modelled grades for lead, arsenic and sulphur for environmental purposes. Both are estimated at low levels; the block model averages are set out in Section 2. Thorium and uranium are hosted principally in monazite and zircon respectively, and their handling, transport, storage and product specification will be managed under the applicable radiation safety regime. This is a material consideration in monazite product marketing.

Access to the tenements is via Dimbulah to Chillagoe, then along the Burke Developmental Road to the Mount Mulgrave turnoff and north to the property, with final access via station tracks and cleared fence lines, a road distance of approximately 250 kilometres from Mareeba. Ground access is not currently available during the wet season.

SUMMARY OF MATERIAL INFORMATION (ASX LISTING RULE 5.8.1)

The following summary is provided in accordance with ASX Listing Rule 5.8.1. Further detail is set out in JORC Code (2012) Table 1 (Appendix A).

Geology and geological interpretation

The Project lies over the southern Yambo Inlier. The mineralisation is a residual heavy mineral sand developed in situ by weathering-driven disaggregation of the underlying Chelmsford Gneiss, a sillimanite–biotite–garnet gneiss of upper amphibolite to granulite grade. The mineralised domain is a flat-lying, clay-poor sheet of fine to very fine sand, extending from surface to an average depth of approximately 11 metres, and is fully oxidised. Grades show no significant surface lag enrichment or basal gravity settling. The domain was wireframed from the RTK-surveyed topographic surface to the drill-intersected bedrock surface, extrapolated to half the drill spacing, and excludes a 426,306m³ zone of unmineralised lithology. The rare earths occur principally in monazite and xenotime, and zirconium and hafnium in zircon, as confirmed by QEMSCAN.

Drilling techniques

The estimate is informed by 144 Stage 1 air core holes (1,488.3m, 2023), 185 Stage 2 air core holes with reverse circulation face hammer finish (2,427.1m, 2023), 218 Stage 3 air core holes with reverse circulation face hammer finish (2,330.5m, 2025, drilled by AED) and five Stage 2 reconnaissance holes within the domain. Drill grids were [60m × 120m and 120m × 120m] (Stage 1), 120m × 120m (Stage 2) and 280m × 280m staggered (Stage 3). All holes are vertical and were drilled to complete the final metre in bedrock. All collars were surveyed by a qualified surveyor using RTK DGPS. Historic (2012) and Company (2023) auger drilling was excluded from the estimate.

Sampling and sub-sampling techniques

Samples were collected by the metre through a cyclone with a gated chute, opened at the end of each metre, and riffle split 12.5:87.5 to produce a representative sample in a pre-numbered calico bag, with the reject retained. Sample recovery was assessed by weighing each metre and comparing it with bulk density measurements; no relationship between recovery and grade was identified. Field duplicates were taken at 1 in 40 to 1 in 45 by riffle split of the sample (Stage 1) or of the bulk reject (Stages 2 and 3). At the laboratory, samples were kiln dried and pulverised to 94% passing 75 microns before aliquot selection. Gravimetric dry loose bulk density was measured on 1 in 3 (2023) and 1 in 4 (2025) samples.

Sample analysis method

Stage 1 and 2 samples were analysed by North Australian Laboratories (AusTest) and Stage 3 samples by NATA-accredited Jinning Testing & Inspection. Rare earth elements, Sc, Y, Th, U, Zr, Hf, Nb, Ta, Sr, Pb and As were determined by sodium peroxide fusion with ICP-MS finish; major elements including Al, Ca, Fe, Mg, P, S, Si and Ti by sodium peroxide fusion with ICP-OES finish; and Na and K by four-acid digest with ICP-OES finish. These are total digestion methods appropriate for resistate minerals. Quality control comprised certified reference standards, laboratory repeats, field duplicates, blanks (Stage 3) and independent fusion calibration standards. QC results were reviewed by a chartered analytical chemist, by the Company's Competent Person in a QAQC report, and by HGS, and the assay data were found to be fit for Mineral Resource estimation with no material bias identified.

For personal use only

Estimation methodology

The MRE was estimated by HGS Australia in Surpac 6.6.2. Samples were composited to 1m, and 31 elements were estimated independently by ordinary kriging into parent blocks of 50m N × 25m E × 2m RL, sub-blocked to 12.5m × 6.25m × 0.5m, using three search passes (200m, 400m and 800m). Top cuts were applied to 28 elements. Mineral species grades were calculated from the estimated element grades using stoichiometry and QEMSCAN-measured elemental deportment. Dry bulk density was estimated by nearest neighbour from 1,893 gravimetric dry loose bulk density measurements averaging 1.53 t/m³. The model was validated by swath plots and sectional comparison with drill data. Tonnages are reported on a dry basis.

Criteria used for classification

Measured Resources are defined in the close-spaced south-western area within ML 100409. Indicated Resources are defined in the 280m × 280m staggered Stage 3 area, the spacing having been selected from variographic sensitivity analysis to support Indicated confidence. Inferred Resources are defined in one area in the central south-east that could not be drilled because of pastoral access. The Competent Person considered drill density, geological and grade continuity demonstrated across three grid spacings, QAQC results, survey quality, density data and the simple, shallow geometry of the deposit.

Cut-off grade, including the basis for the selected cut-off grade

The MRE is reported above a 1,957ppm MzEq lower cut-off grade. The cut-off also coincides with the statistical break between the mineralised and low-grade populations and defines the same geological domain as the previous 700ppm MzEq cut-off on the previous MzEq basis. MzEq is calculated using the assigned values in Table 4 and the recovery assumption stated under Monazite Equivalent. In the Company's opinion all minerals included in the MzEq calculation have a reasonable potential to be recovered and sold.

Mining and metallurgical methods and parameters, and other material modifying factors considered to date

Mining. The mineralisation is unconsolidated, surfaces or near-surfaces, and has a negligible strip ratio. It is considered potentially amenable to free-dig open-pit mining by excavator, loader or dozer without drilling and blasting. No mining dilution or ore loss has been applied, and no minimum mining dimensions have been assumed.

Metallurgy. Mineral Technologies test work produced a monazite-rich concentrate grading 51.9% TREO, with CeO_2 recovery of 71.7% direct and up to 83.8% with recycle of intermediate streams. IHC Mining Phase 1 test work recorded TREO distribution to the heavy mineral fraction of 48.4% on head feed and 71.6% on the deslimed fraction. Approximately 9% of feed reports to the minus 45 micron fraction, and recovery of monazite from that stream is under assessment. Recovery and product quality of garnet, muscovite and biotite have not yet been tested.

Other modifying factors. ML 100409 is subject to a landholder compensation agreement and is covered by a granted Environmental Authority. A cultural heritage survey of the resource area has been completed and an environmental impact assessment is at scoping stage. Thorium in monazite will require concentrate handling, storage and transport under the applicable radiation safety regime. Ground access is not currently available during the wet season. No Ore Reserve has been estimated.

For personal use only

For personal use only

MINERAL ASSEMBLAGE AND END-USE MARKETS

The Sandy Mitchell heavy mineral assemblage comprises monazite and xenotime (rare earth phosphates), zircon, and the titanium minerals ilmenite, altered ilmenite, leucoxene and rutile, together with garnet. Biotite and muscovite mica report to the lighter fraction and are potential co-products.

The commentary below is general information on the end-use markets for these minerals and their contained elements. It is not a statement that the Company will produce or sell any of these products, nor a forecast of production, recovery, product specification or revenue. No economic assessment of any potential co-product has been completed.

Monazite — light rare earth phosphate

Monazite, $(Ce,La,Nd,Th)PO_4$, is the principal rare earth host at Sandy Mitchell and is dominated by the light rare earth elements, together with thorium. Its contained elements have the following established end uses:

- **Neodymium and praseodymium (NdPr)** — the magnet rare earths. Alloyed with iron and boron to make NdFeB permanent magnets, the strongest commercially available magnets. Used in electric vehicle traction motors, direct-drive wind turbine generators, industrial robotics and automation, hard disk drives, speakers and headphones, and defence actuators and guidance systems.
- **Lanthanum** — fluid catalytic cracking catalysts used in petroleum refining, nickel-metal hydride battery alloys, high refractive index optical glass for camera and instrument lenses, and hydrogen storage alloys.
- **Cerium** — precision glass polishing compounds for optics, display glass and semiconductor wafers; automotive catalytic converters; ultraviolet-absorbing and decolourising agents in glass manufacture; and metallurgical alloying.
- **Samarium** — samarium-cobalt permanent magnets, which retain magnetic performance at high operating temperatures and are used in aerospace, defence and downhole applications where NdFeB magnets are unsuitable.
- **Gadolinium and europium, present in minor concentrations** — phosphors for lighting and displays, and neutron-absorbing applications.
- **Thorium** — a naturally occurring radioactive element hosted in the monazite lattice. Thorium is under active international development as a fuel for thorium molten salt reactors. Its presence also requires handling, transport, storage and product specification to be managed under the applicable radiation safety regime, and this is a material consideration in monazite product marketing.

Xenotime — heavy rare earth phosphate

Xenotime, $(Y,Yb,Er,Dy)PO_4$, hosts the heavy rare earth elements, which are considerably scarcer than the light rare earths and generally attract materially higher unit values. Its contained elements have the following established end uses:

- **Yttrium** — yttria-stabilised zirconia used in thermal barrier coatings for gas turbine blades, technical and dental ceramics and solid oxide fuel cell electrolytes; phosphors for LED lighting and displays; yttrium aluminium garnet laser crystals; and high-temperature superconductors.
- **Dysprosium and terbium** — the heavy rare earths added to NdFeB magnets to raise coercivity and preserve magnetic performance at the elevated operating temperatures found in electric vehicle traction motors and wind turbine generators. Both are recognised internationally as supply-critical.
- **Gadolinium** — contrast agents for magnetic resonance imaging, and neutron-absorbing materials used in nuclear reactor control and shielding.
- **Erbium** — erbium-doped fibre amplifiers, which are fundamental to long-haul optical telecommunications, along with surgical and dermatological lasers, and pink colourant in glass and glazes.
- **Holmium, ytterbium and lutetium** — specialty solid-state and fibre lasers, high-strength permanent magnet applications, medical imaging scintillators, radiopharmaceuticals, and calibration standards.

Zircon

Zircon ($ZrSiO_4$) is used principally as an opacifier in ceramic tiles and sanitaryware, where it provides whiteness and surface durability. Other established markets include refractories and foundry sands for high-temperature metal casting, zirconia chemicals and engineered ceramics, abrasives, and nuclear-grade zirconium metal for fuel rod cladding. Value is driven by ZrO_2 content and by low levels of deleterious elements, particularly uranium, thorium, iron and titanium.

Titanium minerals — ilmenite, altered ilmenite, leucoxene and rutile

The titanium mineral suite is feedstock for titanium dioxide pigment, the white pigment used in paints and coatings, plastics, paper, inks, cosmetics and food colouring. Higher-grade rutile and leucoxene are also feedstock for titanium sponge and titanium metal used in aerospace structures, medical implants and chemical plant, and rutile is used in welding rod flux coatings. Value is driven by contained TiO_2 and by the level of chromium, vanadium and other impurities.

Garnet

High-quality garnet commands premium pricing across waterjet cutting, abrasive blasting, water filtration media, lapping and polishing, aerospace and precision manufacturing, and specialised ceramics. Value is driven by hardness, toughness, grain shape and size distribution, chemical inertness and consistent performance across recycling cycles. Almandine garnet is increasingly preferred to silica sand for abrasive blasting because of its very low free crystalline silica content, which reduces the occupational silicosis risk associated with silica-based abrasives.

Muscovite mica

High-purity muscovite mica has potential to access premium-value markets including electrical and thermal insulation, capacitor and semiconductor components, aerospace and defence composites, automotive and industrial paints and coatings, engineered plastics and rubber, pearlescent pigments and cosmetics, joint compounds and construction products, and drilling fluid additives. Value is driven by exceptional purity, low iron content, large flake size, high aspect ratio and consistent specification.

Biotite (black mica)

Biotite has established industrial markets as a ground mineral and functional filler in construction materials, plaster and joint compounds, paints and coatings, plastics and rubber, and as a lost-circulation and viscosity additive in drilling fluids. It is also used as a slow-release potassium source and soil conditioner in agriculture and horticulture. Market value is driven by purity, particle size distribution, flake integrity, refractory potential, and consistent product quality.

NEXT STEPS

- Completion of the IHC Mining metallurgical test work program.
- Completion and release of an updated Scoping Study incorporating the revised MRE and metallurgical results.
- Infill drilling to close off the Inferred area in the central south-east of the resource, subject to pastoral access.
- Restatement of the Exploration Target on the revised MzEq basis and net of the updated MRE.
- A Pre-Feasibility Study, to be prepared with third-party mineral processing specialists, targeted for completion in CY2027.

This announcement has been approved for release to the ASX by the Board of Ark Mines Limited.

ABOUT ARK MINES LIMITED

Ark Mines Limited (ASX: AHK) is an ASX-listed Australian mineral exploration and development company focused on its 100%-owned Sandy Mitchell Rare Earth and Heavy Minerals Project in North Queensland. Sandy Mitchell hosts all critical light rare earths together with heavy rare earths including dysprosium (Dy), terbium (Tb), holmium (Ho), erbium (Er), thulium (Tm), ytterbium (Yb) and yttrium (Y), and a basket of high-value heavy and industrial minerals including zircon, titanium minerals and garnet. The mineralisation is amenable to low-cost, open-pit mining and straightforward beneficiation by gravity processing.

PREVIOUSLY REPORTED INFORMATION

The information in this announcement relating to the previous Mineral Resource Estimate for the Sandy Mitchell Project is extracted from the ASX announcement “Updated Measured Mineral Resource Estimate (MRE) at Sandy Mitchell Rare Earth and Heavy Mineral Project” released on 2 October 2024. The information relating to the Exploration Target is extracted from the ASX announcement “Sandy Mitchell Project Exploration Update” released on 6 November 2024. The information relating to the Stage 3 drilling results is extracted from the ASX

announcement "Sandy Mitchell Stage 3 Resource Expansion Drilling Results" released on 20 August 2026. The information relating to the Scoping Study is extracted from the ASX announcement "Sandy Mitchell Scoping Study delivers a commercial Rare Earth and Heavy Mineral operation" released on 11 December 2024. Each of these announcements is available at www.arkmines.com and on the ASX Market Announcements Platform.

The Company confirms that it is not aware of any new information or data that materially affects the information included in those market announcements and, in the case of estimates of Mineral Resources, the Exploration Target and the production target and forecast financial information derived from it, that all material assumptions and technical parameters underpinning the estimates continue to apply and have not materially changed, other than as disclosed in this announcement in relation to the Mineral Resource Estimate and the Exploration Target.

COMPETENT PERSON'S STATEMENT

Mineral Resource Estimate and Exploration Target

The information in this announcement that relates to the Mineral Resource Estimate and to the Exploration Target is based on, and fairly reflects, information compiled by Andrew James Hawker of HGS Australia, a Competent Person who is a Member of The Australasian Institute of Mining and Metallurgy (No. 210569) and a Member of the Australian Institute of Geoscientists (No. 5343). Mr Hawker is the Principal Geologist and sole director of Hawker Geological Services Pty Ltd trading as HGS Australia, and is independent of the Company. Mr Hawker has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration, and to the activity being undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Hawker consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears.

Exploration Results

The information in this announcement that relates to Exploration Results is based on, and fairly reflects, information compiled by Daemon de Chaeney, a Competent Person who is a Member of AusIMM and a Member of AIG. Daemon de Chaeney is employed by Ark Mines Limited. Daemon de Chaeney has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration, and to the activity being undertaken, to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Daemon de Chaeney consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears.

MINERAL RESOURCE STATEMENT

The resource estimates are classified in accordance with the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (JORC, 2012). The estimate was completed by Andrew Hawker of HGS Australia. Mr Hawker has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration, and to the activity being undertaken, to qualify as a Competent Person as defined in the JORC Code (2012). Mr Hawker consents to the inclusion in this announcement of the matters based on his information in the form and context in which it appears. The classification was considered appropriate based on drill hole spacing, sample intervals, geological interpretation, the representativeness of all available assay and density data and the QAQC evaluation, and reflects the confidence in short-range grade estimations in the model. The Mineral Resource is reported on a dry in-situ basis. No Ore Reserve has been estimated for the Project, and the Mineral Resource is therefore reported without reference to any Ore Reserve.

FORWARD-LOOKING STATEMENTS

This announcement contains forward-looking statements, including statements regarding the updated Mineral Resource Estimate, the Exploration Target and its intended restatement, metallurgical test work, the updated

For personal use only

Scoping Study and the Pre-Feasibility Study, and the potential markets and applications for the minerals identified at Sandy Mitchell. Forward-looking statements are based on the Company's current expectations and assumptions as at the date of this announcement and are subject to known and unknown risks, uncertainties and other factors, many of which are outside the Company's control. Actual results, performance and achievements may differ materially from those expressed or implied. References to end-use markets and applications are general market information and do not constitute a representation that the Company will produce, recover or sell any product, or achieve any particular product specification, recovery, price or revenue. Investors should make and rely upon their own enquiries before deciding to acquire or deal in the Company's securities. To the maximum extent permitted by applicable laws, Ark Mines makes no representation and gives no assurance, guarantee or warranty as to the accuracy or completeness of any forward-looking information contained in this announcement. The Company does not undertake to update any forward-looking statement except as required by law.

SANDY MITCHELL REE PROJECT

Resource Evaluation Report

For Ark Mines Ltd

August 2026

Andrew Hawker (*BSc. Geol MAusIMM MAIG MSEG AWASM)*

Principal Geologist

HGS Australia

Version – FINAL

For personal use only

EXECUTIVE SUMMARY

At the request of Ark Mines Ltd (Ark), HGS Australia (HGS) conducted a resource update of the Sandy Mitchell REE Project located in northern Queensland.

This resource is a significant update on the November 2024 resource with additional drilling covering an area from 4.05km² in 2004 to 23.3km² in 2026, an increase of 19.25km². The major update included an increase in drilling of 218 holes for 2330m.

The project is located 230 km north-west of Cairns and 200km north north-west of Chillagoe in Far North Queensland

HGS created a new database from spreadsheets of collars, surveys, geology and assay data provided by Ark. A new database was requested due to additional elements assayed and calculations for minerals/compounds. A high-quality QAQC sampling protocol and report was conducted by Arc and validated by HGS.

The mineral resource estimate is based on a number of factors and assumptions:

- The data was supplied by Ark in excel files.
- Validation work was conducted and the database is considered valid.
- A mineralised outline was conducted by Ark and validated by HGS within the coordinates:
    - 8193000 N to 8198200 N,
    - 812300 E to 817400 E and
    - 115RL to 205RL.
- The interpretation was used in compositing the sample data.
- Sample data was composited to 1m intervals, and 31 elements were extracted for statistical analysis and interpolation.
- A surface topography profile was created by HGS using drill hole collars.
- The mineralisation is flat and exposes the surface to a depth of approximately 11m.
- A geological block model was constructed by HGS using Surpac. The main model cell sizes are 50m North, 25m East and 2m RL, with sub-celling to a minimum of 12.5 North, 6.25m East and 0.5m RL.
- Bulk density data was sufficient to interpolate into the model.
- Ordinary Kriging interpolation method was used for the evaluation of each of the 31 elements.
- High-grade cutting was conducted on outlier assays for most of the elements.
- The resource is classified as mostly indicated with Measured in the southwest due to a much tighter data density and inferred in one small area where drilling could not be conducted due to pastoral issues.

A block model was created in Surpac (version 6.6.2 x64) called:

- "**sandy_mitchel_model_aug2026.mdl**". Uses Ordinary Kriging (OK) interpolation on the upper-cut datasets.

The monazite equivalent (MzEq) value is considered the appropriate combination for reporting due to the potential to process the ore as a concentrate for shipment, therefore providing a more representative grade.

The Sandy Mitchell Mineral Resource is reported at a 1957ppm MzEq lower cut-off grade. The November Resource is classified under JORC code as Measured as follows:

MzEq Cut-off	Tonnes	Mzeq (ppm)	Alt Ilmenite (ppm)	Creo (ppm)	Hi Ti Leucoxene (ppm)	Ilmenite (ppm)	Lo Ti Leucoxene (ppm)	Magreo (ppm)	Monazite (ppm)	Rutile (ppm)

1.0 INTRODUCTION

HGS Australia (HGS) at the request of Ark Mines Ltd (Ark) conducted a 2012 JORC compliant resource evaluation on the Sandy Mitchell Rare Earth Metals Project in northern Queensland.

The Sandy Mitchel project area was selected as a target based on the Sandy Creek drainage system which empties into the Mitchell River. The creek drains a large area of Mesoproterozoic metasediments of the Yambo Inlier which has been intruded by lower Palaeozoic granitoids. These rock units have been shown historically to contain heavy minerals and REEs within them and within their weathered profiles.

The major minerals containing rare earths are monazite and xenotime which are recovered from beach sand and mineral sand deposits. Early exploration in the Sandy Mitchell area was for heavy minerals (Laskan Minerals Pty Ltd, 1970). Subsequent exploration (O'Toole, 1982; Barron, 1990) concentrated on the heavy mineral content of all the creeks and streams draining the Inlier. The most recent exploration programs were carried out by BHP Billiton in a wider ranging exercise for nickel, copper and PGE, (Crosato, 2007).

This resource is a significant update on the November 2024 resource with additional drilling covering an area from 4.05km² in 2024 to 23.3km² in 2026, an increase of 19.25km². The major update included an increase in drilling of 218 holes for 2330m. The resource includes additional elements from the November 2024 resource of Fe, Mn, Mg and Al, plus additional compound/mineral calculations for garnet, muscovite, biotite, THM (total commercial minerals) and TCM (total heavy minerals).

The data supplied by Ark was extensive with wireframe interpretations of mineralisation, QAQC reporting and spreadsheet data containing collar, survey, assay, geology and downhole density results. The report includes multiple element reporting and stoichiometric calculation factors for oxides and element ratios of minerals.

HGS conducted statistical analysis and interpolated individually all elements into the model and conducted block math for the stoichiometric formulae.

For personal use only

The objective of this study is to produce a resource estimation of the elements that define REE as well as deleterious and other compound forming elements. The final outcome was in determining the monzonite equivalent (MzEq) as the mineable product will be sold as a concentrate.

The grid system used was MGA2020 zone 54.

2.0 DISCLAIMER

This disclaimer must accompany every copy of this Report, which is an integral document and must be read in its entirety.

2.1 Statement of Capability and Independence

Ark has commissioned HGS to prepare this report. The author Mr. Andrew James Hawker is a consulting geologist with over 35 years of experience in mineral exploration, development, resource estimation and mining of mineral projects. Mr Hawker has worked for many mining and exploration companies in exploration, underground & surface mining, and resource evaluations before founding HGS Australia (geological consultancy) in 2009. Mr. Hawker has experience in all areas of Australia, Middle East, West Africa and Ukraine. His experience includes performing and assisting in resource studies for precious and base metals, iron ore, strategic metals, and industrial metals. HGS has assisted and conducted exploration and resource evaluations for over 70 clients including, setting up quality control systems for sampling and assaying, geological modelling, grade estimation, ore management processes and procedures, evaluation of mineral projects for scoping studies and feasibility studies and auditing of mineral resource studies.

Mr. Hawker is a member of the Australian Institute of Geoscientists (MAIG #5343) and the Australasian Institute of Mining and Metallurgy (MAusIMM #210569).

Mr. Hawker is independent of Ark and has no equity interest in either Company or any of their projects, nor is he entitled to any future interest in the Company nor its projects. Payment for services is based on standard professional fees that are not contingent on the conclusions of this report.

2.2 Data Provided

HGS is satisfied that Ark has made available copies of all relevant information it holds and has used in the preparation of the Resource Evaluation Report. This Report has been prepared from information available up to 14th August 2026. Any conclusions expressed in this report are therefore only valid before this date

For personal use only

and may change with time in response to variations in economic, market, legal or political factors, in addition to on-going exploration results.

2.3 Field Visits

A field visit was conducted by HGS covering the Sandy Mitchel Project on the 11th of November 2025. Details are in Section 15.

2.4 Forward Looking Statements

This report contains certain statements that may be deemed to be “forward looking statements” All statements, other than statements of historical fact, which address events or developments that HGS, or Ark expects to occur, are forward looking statements.

Forward-looking statements are statements that are not historical facts and are generally but not always identified by the words “expects”, “plans”, “anticipates”, “believes”, “intends”, “estimates”, “projects”, “potential” and similar expressions, or that events or conditions “will”, “would”, “may”, “could” or “should” occur.

Although HGS believes the expectations expressed in such forward-looking statements are based on reasonable assumptions, such statements are not guarantees of future performance and actual results may differ materially from those in the forward-looking statements. Factors that could cause the actual results to differ materially from those in forward-looking statements include market prices, exploration and production successes or failures, continued availability of capital and financing, inability to obtain required shareholder or regulatory approvals, and general economic market or business conditions.

Forward-looking statements are based on the beliefs, estimates and opinions of HGS on the date the statements are made.

2.5 JORC Compliance Statement

The information in this report that relates to Exploration Targets, Exploration Results, Mineral Resources or Ore Reserves is based on information compiled or reviewed by Mr Andrew James Hawker, a Competent Person whois a Member of The Australasian Institute of Mining and Metallurgy, and the Australian Institute of Geoscientists. Mr Hawker is the Principal Geologist employed by Hawker Geological Services Pty Ltd trading as HGS Australia.

Mr Hawker has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined inthe 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Hawker consents to the inclusion in the report of the matters based on his informationin the form and context in which it appears.

2.6 Competent Person Consent

I, Andrew James Hawker, confirm that I am the Competent Person for this Report and:

- I have read and understood the requirements of the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (JORC Code, 2012 Edition).
- I am a Competent Person as defined by the JORC Code, 2012 Edition, having five years' experience that is relevant to the style of mineralisation and type of deposit described in the Report, and to the activity for which I am accepting responsibility.
- I am a Member of The Australasian Institute of Mining and Metallurgy (No: 210569) and the Australian Institute of Geoscientists (No: 5343).
- I have reviewed the Report to which this Consent Statement applies. I am a full-time employee of Hawker Geological Services Pty Ltd trading as HGS Australia.

I have disclosed to the reporting company the full nature of the relationship between myself and the company, including any issue that could be perceived by investors as a conflict of interest.

I consent to the release of the Report and this Consent Statement by the directors of Ark Mines Limited.

Andrew James Hawker

Sole Director & Principal Geologist

Hawker Geological Services Pty Ltd

3.0 LOCATION

Sandy Mitchell is located 230 km north-west of Cairns and 200 km north north-west of Chillagoe in Far North Queensland (Figure 1).

Access to the tenement is via Dimbulah to Chillagoe, then along the Burke Developmental Road to the Mount Mulgrave turnoff, proceeding north to that property. Access to the tenement is then via station tracks and cleared fence lines to the west of the station. The road distance from Mareeba is approximately 250 kilometers.

Access is not available during the wet season.

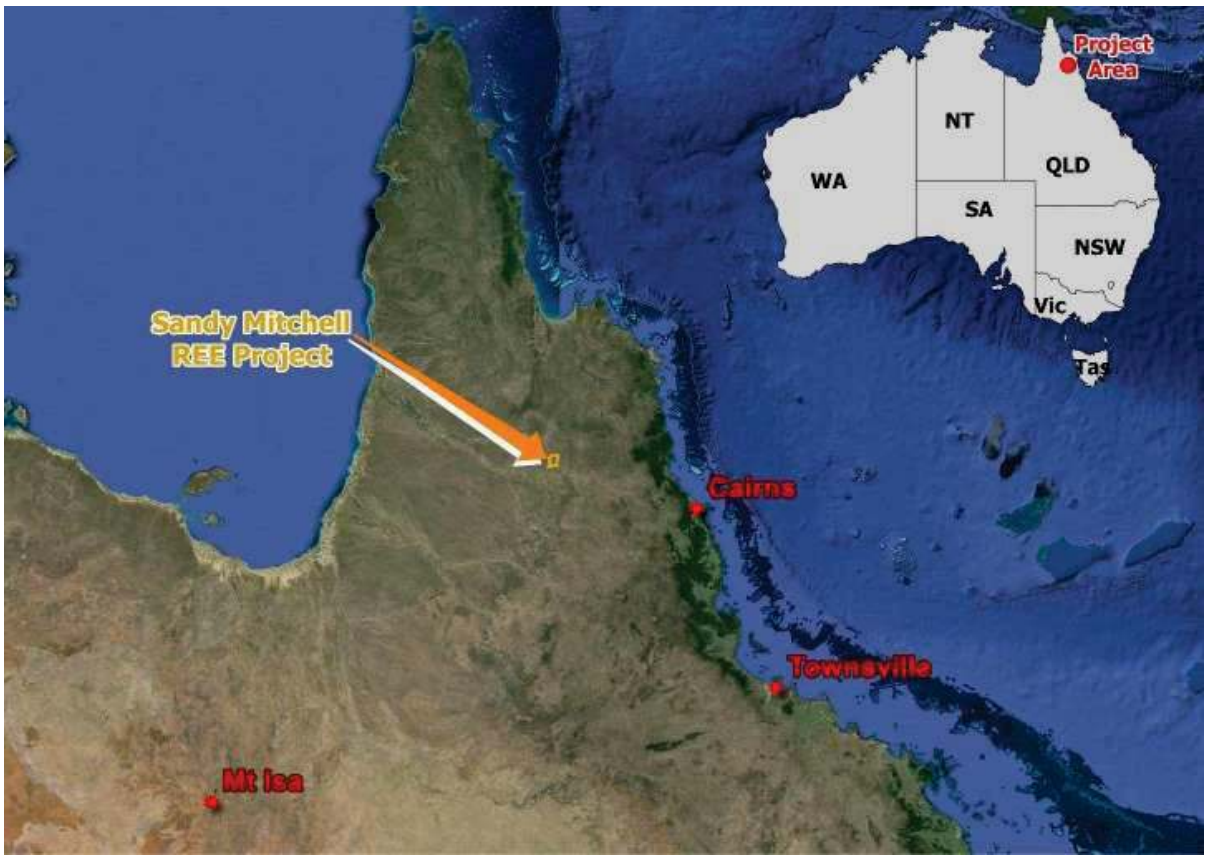

Figure 1: *Sandy Mitchel location plan.*

4.0 TENEMENT

Ark Mines Sandy Mitchell REE project is located across two tenements, EPM28013 and ML100409 both under ownership of Ark Mines Ltd, (Figure 2): EPM28013 has an area of 161.2km², was granted on 22/08/2022 and expiry date of 21/08/2027. ML100409 has an area of 4.04km^2, was granted on 12/03/2026 and expiry date of 31/03/2036.

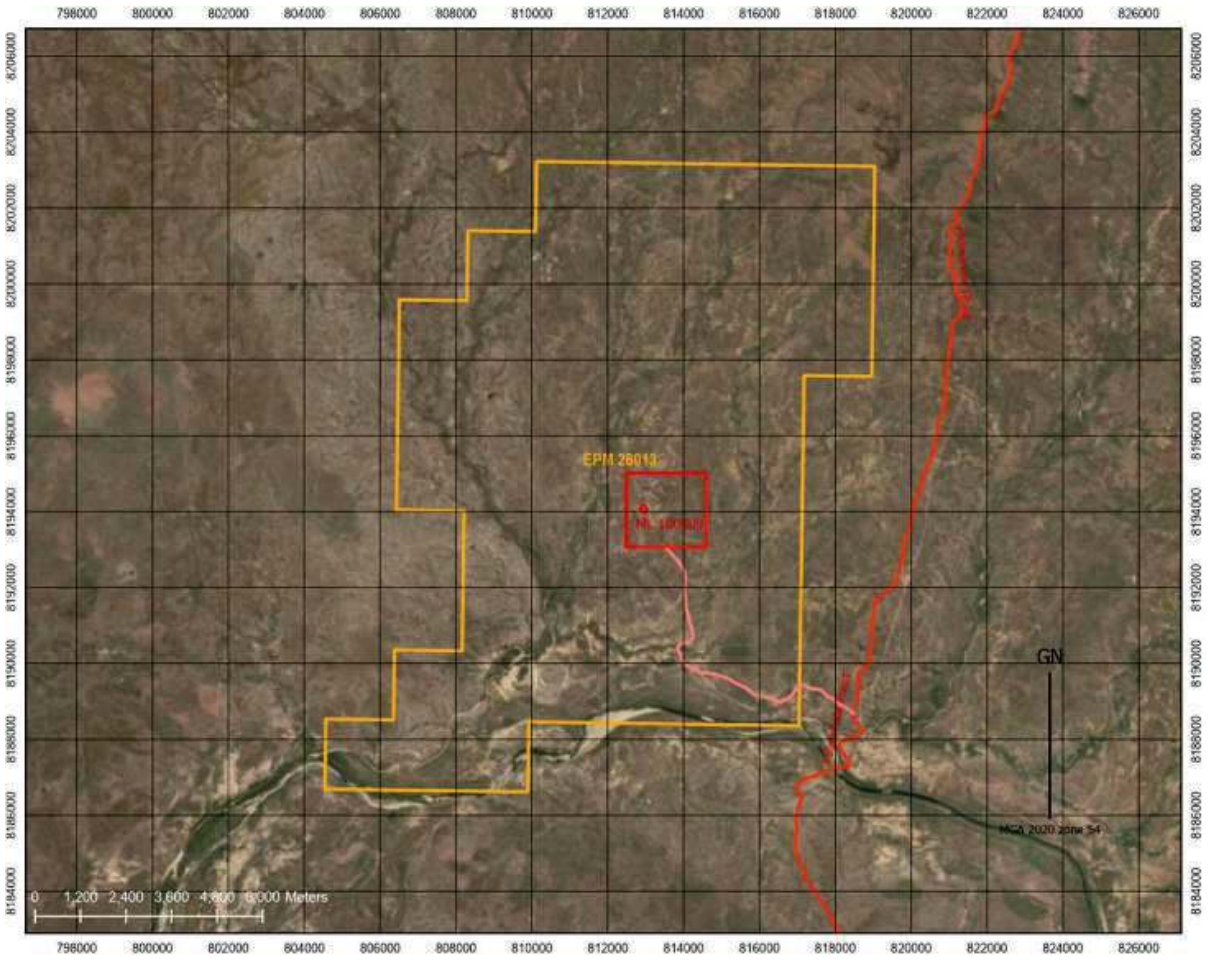

Figure 2: *EPM28013 (orange) and ML 100409 (red) with its granted access (light red), over satellite imagery.*

For personal use only

5.0 GEOLOGY and MINERALISATION

The tenement covers portion of the southern extent of the Yambo Inlier, one of the several Proterozoic inliers to the west of the Palmerville Fault System.

Rocks of the Yambo Inlier covered by the tenement comprise those of the middle Proterozoic Yambo Metamorphic Group of mainly amphibolite's and gneisses ranging in age from ~1690 Ma to ~1585Ma. These rocks have been intruded by Silurian-Devonian granites of the Lukinville Suite which form an integral part of the Cape York Batholith. Within the tenement they form a belt roughly 10 km wide trending NNW.

Governmental radiometric surveys (Bain, 1997) highlighted areas of anomalous radiometric emission within the Yambo Inlier, (Figure 4).

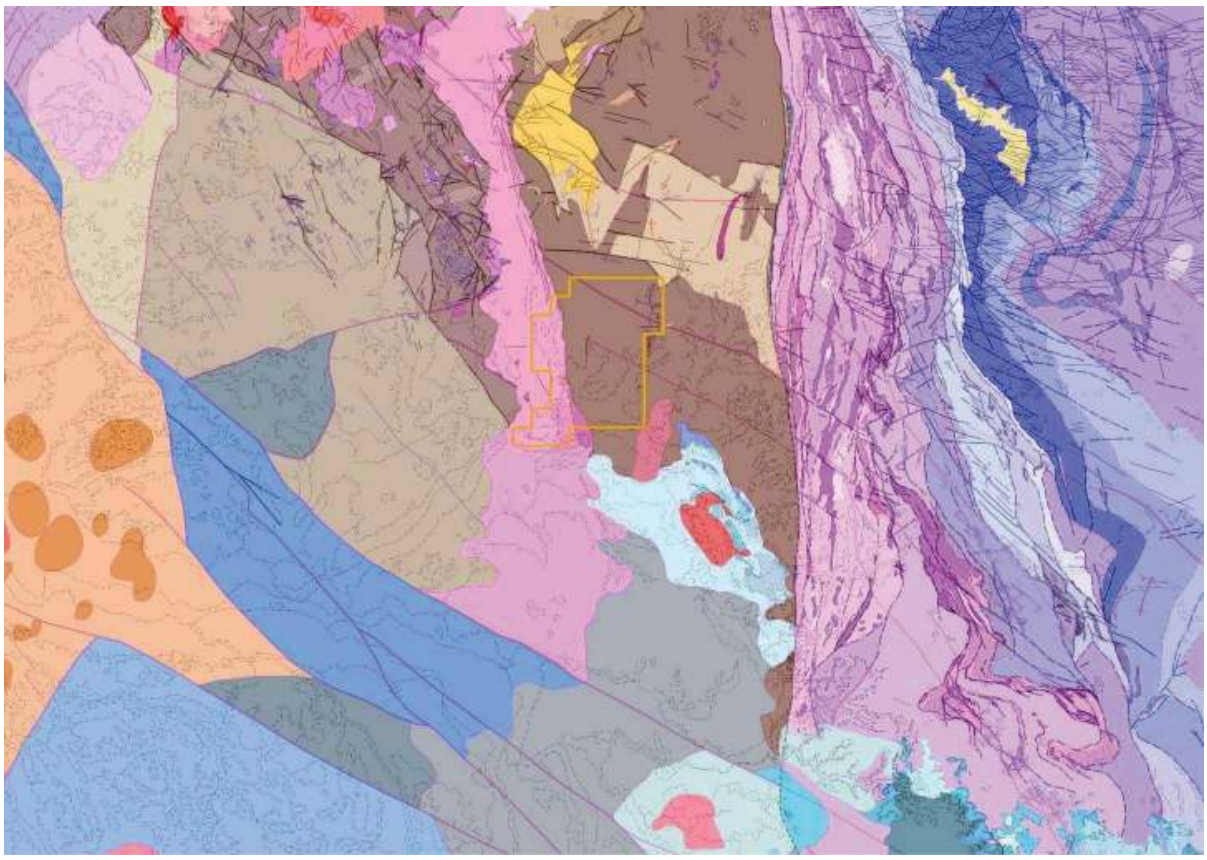

Figure 3: *Interpreted 100k Geology.*

EPM 28013 is underlain by the Paleo- to Mesoproterozoic Chelmsford Gneiss in its eastern two thirds (Figure 3). The Chelmsford Gneiss is part of the Yambo Metamorphic Group. It is a sillimanite biotite garnet

For personal use only

gneiss of upper amphibolite to granulite grade, and incorporates spatially associated two mica granite, hornblende amphibolite, a two pyroxene mafic granulite and areas of metapelites including quartzite (Withnall, Blewett & Champion 2013). Migmatisation is apparent in some areas of outcrop with clear separation of leucosome and melanosome components. Outcrops are sparse and largely confined to low hills.

The western third of the tenement is underlain by later intrusions belonging to the Kintore Supersuite, dominated by the early Devonian, foliated and porphyritic, S-type, Lukinville Granodiorite. Geochemically, the Lukinville Granodiorite is known to show positive Eu anomalism (Bultitude, Champion & Hutton 2013), thought to be related to incorporation of cumulate plagioclase, but is not genetically related to the Sandy Mitchell mineralisation. Three other early Devonian intrusives have been identified by the QLD Geological Survey, based on remote geophysics, but are unnamed.

The tenement is prospective for rare earth elements (REE) in the form of monazite and xenotime, as well as zircon, rutile, leucoxene, Ilmenite and garnet heavy minerals (HM) as well as commercial muscovite and biotite.

The REE bearing material is the fine to very fine sand fraction (de Nooy 2010, 2024) in a polymictic, polymodal, angular to sub-rounded, unconsolidated sediment package which is largely devoid of clays through tropical cyclical weathering and drainage. This unconsolidated HM sediment is located over the Chelmsford Gneiss and in minor ephemeral streams that are fed from, or cross, the Chelmsford Gneiss. This includes Sandy Creek which traverses the Lukinville Granodiorite but starts within the gneiss north of the tenement and is fed from multiple minor streams that drain the gneiss area in the wet season. The HM sands are well correlated with a strong thorium band radiometric anomaly (Figure 3) which also highlights their relationship with local drainage.

The HM sands are considered to have formed in situ by weathering driven disaggregation of the underlying Chelmsford Gneiss. There are several compelling lines of evidence to support this in Ark's exploration data:

- Angular clasts of moderately soft monazite and xenotime are pervasive.
- Muscovite flakes and well crystalised biotite books up to 15mm in size are common throughout.
- The polymictic clasts identified in logging were Chelmsford lithologies such as biotite amphibolite or mafic granulite with occasional quartzites or muscovite quartzite.
- The sands, which can be over 20m thick in places, are extremely tightly packed to the

For personal use only

point where a boosted air core rig struggles to penetrate.

- There is no real sorting; even though rounded to subrounded pebble sized material occurs in definite horizons these are dispersed throughout the sand layer with greater concentration immediately above the bedrock.
- The HM grades are relatively evenly distributed with respect to profile depth, with no substantial lagging enrichment at the top of the pile, or gravity settling at the bottom, however, there is very substantial enrichment in even the smallest ephemeral stream.
- Where drilling penetrates the gneiss, the grades of REE and HM are only slightly lower than the overlying sands.

This type of HM sand mineralisation is sometimes referred to as saprolite sands, though this is a misnomer in the case of the Sandy Mitchell Project, as there is very little secondary clay through the profile, and surficial clays in the top metre are considered transported by the wet season flood wash.

The entire sand horizon, and the top of the underlying bedrock is fully oxidised. Figure 5 shows a typical cross section through the REE and HM sands from within the heavily drilled Stage 1 resource area.

6.0 DATABASE

The database was created by HGS using Surpac data importer into an Access Database. The data was provided to HGS as csv files containing collars, downhole surveys, assays, geology and downhole density data. The only changes to the database from the November 2024 evaluation is the addition of Fe, Mn, Mg and Al.

A full comprehensive QAQC report on the 2025 Stage 4 drilling, conducted by Daemon de Chaeney, was provided to HGS to review for this resource evaluation. A copy of the report is located in Appendix 6.

The quality assurance measures applied to drilling and sampling were to a high standard with the procedural deficits identified and corrected on site.

The quality control measures applied to sample and assay were best practice and the resultant QC data affords comprehensive analysis of the assay set. The minor anomalies identifiable in the QC data are of small enough magnitude that they are not material.

The QAQC shows the assay data to be of good quality and fit for the purpose of estimating a JORC 2012 resource mode with good confidence.

6.1 Drilling, QAQC and Sampling Process

There are four generations of drilling within the Sandy Mitchell Project, detailed below and summarised in Table 1:

In 2012 Walter Scott & Partners drilled 101 auger holes (Scott W, 2013):

- Drilling was 3 fences approx. 9km long with holes at approx. 250m.
- Depths were not recorded but a 102mm auger on a mini excavator was used, with a reach of 6m and drilling was to refusal with all holes vertical.
- Sample was collected off the collar and riffle split 25:75 to yield a representative single composite sample.
- Assay was for Ce, Cs, Dy, Er, Eu, Ga, Gd, Hf, Ho, La, Lu, Nd, Pr, Sc, Sm, Tb, Tm, Al,

For personal use only

Ca, Cr, Fe, K, Mg, Mn, Na, P, Si, Ti, Zr, Y and Yb.

- QC included dupes at 1 in 13 and twins at 1 in 100.
- Collar survey was by handheld GPS.

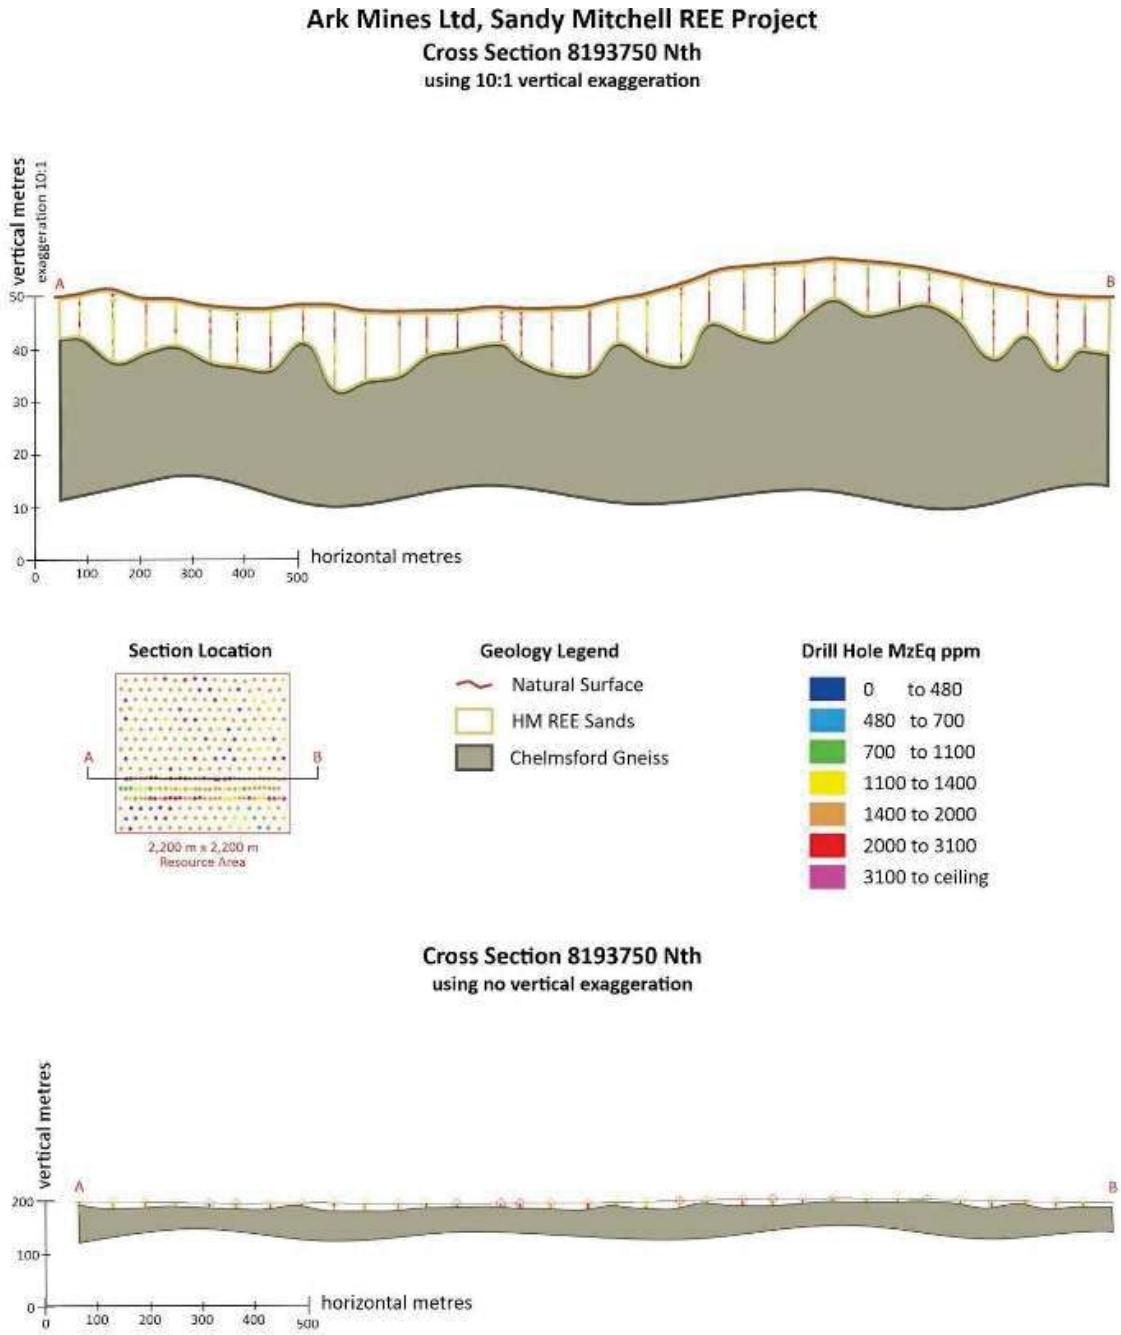

Figure 5: *Sandy Mitchell Project west to east cross section at 8193750 m north through the REE & HM sand, showing drill data from the Stage 1 resource AC drill grid coloured for monazite equivalent.*

Showing in Figure 5, the upper section has a vertical exaggeration of 10x to afford visibility of the drill data at the scale of the drill section. The lower section is the same section without vertical exaggeration, i.e. at true scale, illustrating why exaggeration is required to visualise the data. Note, the vertical exaggeration

For personal use only

has the effect of magnifying topological variation as well as making the drill data visible. The lower section provides a realistic idea of the topography and basement variability of this relatively low relief terrain.

In June to July 2023 AHK drilled its Stage 1 resource programme; 144 air core (AC) holes for 1488.3m:

- Drilling was by 100mm AC bit using a Comacchio track mounted rig and auxiliary compressor.
- Drilling consisted of 3 lines at 60m x 120m plus 3 lines at 120m x 120m.
- Depths varied between 3.0 and 18.0 m with the mean depth being 10.3m and holes were pushed to refusal at the bedrock horizon, with all holes vertical (Figure 5).
- Sample was collected by the metre by passing through a cyclone and opening a manual gate at the end of each metre to release the sample into a tuff tub, which was then put through a 12.5:87.5 splitter to produce a metre representative sample in a prenumbered calico bag, and a conserved reject in a plastic bag.
- Assay was conducted at North Australian Laboratories (an AusTest facility):
    - Sc, Y, La, Ce, Pr, Nd, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu, Th, U, Zr, Hf, Nb, Ta, Sr, Pb and As were assayed by sodium peroxide fusion in nickel crucibles with ICP-MS finish.
    - Al, Ca, Cr, Fe, Mg, P, S, Si and Ti were assayed by sodium peroxide fusion in nickel crucibles with ICP-OES finish.
    - Na and K were assayed by 4 acid digest with ICP-OES finish.
    - Gravimetric moisture was measured at 1 in 5.
    - Gravimetric dry loose bulk density was measured at 1 in 3.
- QC included:
    - Field duplicates at 1 in 40 by 50:50 riffle split of representative sample.
    - Lab repeats at 1 in 8.
    - Standards at 1 in 24
    - Grind size tests at 1 in 34.
    - 1 drill twin.
- Sample was logged by the metre on site and drilling/sampling operations were under geological supervision.
- Survey was conducted by a qualified surveyor using RTKdGPS.

In November to December 2023 AHK drilled its Stage 2 resource programme; 185 AC/RC holes for 2427.1m.

- Drilling was by 100mm air core bit with 100mm RC face hammer finish, using a AusRoc 4000 multi-purpose rig with on board air.
- Drilling consisted of 10 lines at 120m x 120m.
- Depths varied between 4.1 and 26m with an average of 13.0m and the last metre finishing in bedrock by face hammer, with all holes vertical.
- Sample was collected by the metre by passing through a cyclone and opening a manual gate at the end of each metre to release the sample through a rig mounted 12.5:87.5 splitter to produce a metre representative sample in a prenumbered calico bag, and a conserved reject in a plastic bag.
- Assay was conducted at North Australian Laboratories (an AusTest facility):
    - Sc, Y, La, Ce, Pr, Nd, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu, Th, U, Zr, Hf, Nb, Ta, Sr, Pb and As were assayed by sodium peroxide fusion in nickel crucibles with

For personal use only

ICP-MS finish.
    - Al, Ca, Cr, Fe, Mg, P, S, Si and Ti were assayed by sodium peroxide fusion in nickel crucibles with ICP-OES finish.
    - PPB Au by low level Fire assay with ICP-MS finish on second metre and last metre samples.
    - Na and K were assayed by 4 acid digest with ICP-OES finish.
    - Gravimetric moisture was measured at 1 in 4.
    - LOI was measured at 1 in 8.
    - Gravimetric dry loose bulk density was measured at 1 in 3.
- QC included:
    - Field duplicates at 1 in 45 by 12.5:87.5 riffle split of bulk reject sample.
    - Lab repeats at 1 in 9.
    - Standards at 1 in 10.
    - 8 AC Drill twins equating to 1 in 22 (excluding 2 auger twins)
- Sample was logged by the metre on site and drilling/sampling operations were under geological supervision.
- Survey was conducted by a qualified surveyor using RTKdGPS.

This Stage 2 resource programme was accompanied by a Stage 2 reconnaissance programme of 32 AC/RC holes for 393m.

- The drill, sampling methodology, assay regime, survey and QAQC were in all respects identical to the Stage 2 resource programme.
- Depths varied between 4.0 and 30m with an average of 12.3m and the last metre finishing in bedrock by face hammer, with all holes vertical.
- Drilling was widely spaced to cover as much of the tenement as possible, with distribution controlled by rig access on existing tracks and fence lines.

In December 2023 AHK commenced its Stage 3 auger exploration grid to test the total prospective area of the tenement. The initial line of this programme was drilled in December as proof of concept with:

- Drilling was by 105mm auger bit using a Rockmaster ute mounted auger.
- Hole spacing was approx. 360m.
- Depth varied between 1.5 and 5.0m with an average of 3.0m and were controlled by penetration refusal in the very tight sands using this relatively light weight rig.
- All holes were vertical.
- Sample was collected by the metre by being lifted up a collection tube via rotation of the auger flights, then passing through a collection chute into a tuff tub which was then put through a 12.5:87.5 splitter to produce a metre representative sample in a prenumbered calico bag, and the reject allowed to spill.
- Assay regime and QAQC were in all respects identical to the Stage 2 resource programme.
    - 2 auger twins of AC holes within the stage 2 resource grid (5.8m and 4.1m) were produced for auger programme QC, and these are not counted as reconnaissance metres.
- Survey was conducted by handheld GPS, which is considered adequate for this type of widely spaced reconnaissance work.

For personal use only

In December 2023 AHK drilled 2 water monitoring bores of 32m and 30m.

- These vertical holes were drilled by 102mm open hole percussion bit.
- Hole location was set out by AHKs hydrologist.
- Sample was collected at the collar by spear and released into a prenumbered calico bag without splitting.
- Assay regime and QAQC were as per the Stage 2 resource grid, with the exception that no field duplicates were taken.
- For analytical purposes this report treats the above bedrock assay data of these holes as part of the auger reconnaissance data set.
- Survey was conducted by a qualified surveyor using RTKdGPS.

In August to September 2025 AHK drilled a stage 4 programme aimed at resource extension. The programme comprised 220 AC holes with RC finish for 2334.8m, including two failed stubs for 4.3 m, leaving 218 productive holes.

- Drilling and sampling methodology were identical to Stage 2, including the use of the same drill by the same drilling company.
- Drilling was on a 280m x 280m staggered pattern on 18 east west lines with all holes vertical and the Stage 4 pattern abutting the north and east side of the stage 1 and 2 drilling that informed the maiden MRE.
    - This Stage 4 spacing was determined by sensitivity analysis of the HGS Australia maiden MRE variography to yield a data density that could support indicated confidence classification.
- Stage 4 drill hole depth varied between a minimum of 2.3m to a maximum of 28m with a mean depth of 10.7m.
- Stage 4 mineral sand depth varied between a minimum of 1m to a maximum of 25m with a mean depth of 10.0m.
- The Stage 4 resource data set includes five stage 2 reconnaissance holes that fall within the Stage 4 drill pattern, and which were drilled with the same rig using the same techniques for both drilling and sampling in November 2023.
- Samples were collected by the metre via passing through a gated cyclone to a 12.5 : 87.5 riffle splitter to yield a representative sample per metre in a prenumbered calico bag.
- Duplicate sample at the 1 in 40 programme scheme rate were taken by passing the bulk reject through a 12.5 : 87.5 riffle splitter to yield the duplicate in a prenumbered calico bag, plus the reject recaptured in a numbered UV resistant green bag.
- Duplicate bags were of the same series as representative sample bags and recorded as duplicates, preserving duplicate anonymity to the lab.
- Samples were logged by the metre on site and drilling / sampling operations were under geological supervision.
- Assay was conducted by Lab West Jinning (a Phenna Group facility):
    - Sc, Y, La, Ce, Pr, Nd, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu, Th, U, Zr, Hf, Nb, Ta, Sr, Pb, As, Sn, W and Si were assayed by sodium peroxide fusion in nickel crucibles under agitation, with inductively coupled plasma mass spectrometry (ICP-MS) finish.
    - Al, Ca, Cr, Fe, K, Mg, Mn, Na, P, S, and Ti were assayed by four acid digest with inductively coupled plasma optical emission spectroscopy (ICP-OES) or inductively coupled plasma mass spectrometry (ICP-MS) as appropriate for the element.

For personal use only

For personal use only

  - PPB Au, Pt and Pd by low level Fire assay with ICP-MS finish on second metre and last sand metre samples.
  - Gravimetric moisture was measured at 1 in 5.
  - Gravimetric dry loose bulk density was measured at 1 in 4.
- QAQC included:
  - Field duplicates at 1 in 40 by 12.5 : 87.5 riffle split of the total reject sample.
  - Lab repeats at 1 in 12.
  - Certified standards at 1 in 14.
  - Blanks at 1 in 40.
- Further QC measures included full analysis of all results by an independent analytical chemist and data management consultant, with all QA anomalies flagged back to the assay lab with required mitigating actions specified, including partial and whole batch re-fusing, re-reading and extra controls (used by the lab internally to control for fusion parameter variation), standards and repeats as necessary to maximise the quality of assay return accuracy and precision.
- Collar survey was by qualified surveyor using real time kinematic differential GPS (RTKdGPS) with precision in X and Y of 20mm, and precision in Z 200mm.
- High density infill survey between and beyond drill collars, include drainage channels, was carried out to allow high accuracy RTKdGPS digital terrain modelling approx. 450m beyond the acceptable interpolation perimeter of resource estimation.
- Final assay returns from Lab West Jinning were received 22nd July 2026 and QAQC analysis has been completed and no materially significant anomalies have yet been identified and the data appears well conditioned, as would be expected from the comprehensive QAQC procedures under which the programme was conducted including independent analytical chemist driven feedback and control on lab results.

Table 1: *Summary of Sandy Mitchell Project drilling.*

Detailed analysis of AHK Stage 1 and Stage 2 QAQC shows a well conditioned and comprehensive series of checks that have been applied to self-correct sampling issues as they arose. Few assay anomalies are present, such as a slight downward bias of some elements in some standards, and they have been quantified as minor and not materially significant.

Stage 3 is considered to be of equivalent QAQC quality, with the results being considered as below resource confidence standards due only to the drill type involving outside sample return with concomitant

contamination potential, equivalent to a RAB sample. The data is of good quality for exploration purposes and examination of the data shows none of the patterns or biases typical of significant up hole contamination.

Stage 4 QAQC is considered to be superior to Stage 1 and 2 and is well conditioned with checks and balances that go well beyond the ordinary resource programme. QAQC audits and analysis has been completed and no material anomalies or systematic errors have been identified.

7.0 INTERPRETATION, COMPOSITING & STATISTICS

Interpretations were conducted by Ark and validated by HGS for drill hole snapping and geological controls. The change in interpreted wireframe size was considerable due to the addition of 218 holes for 2330m covering an additional area of 4.05km² in 2024 to 23.3km² in 2026, an increase of 19.25km².

Structurally, though, there is no change in the interpretation process with the deposit surfacing or near surfacing and extending vertically to approximately 11m creating a sheet-like look (Figure 6).

A small gap exists in the drilling in the central south-east corner due to access restrictions with pastoral operations. This has identified an area of inferred resource and drilling will be planned in the future to close off the indicated/measured resource drilling.

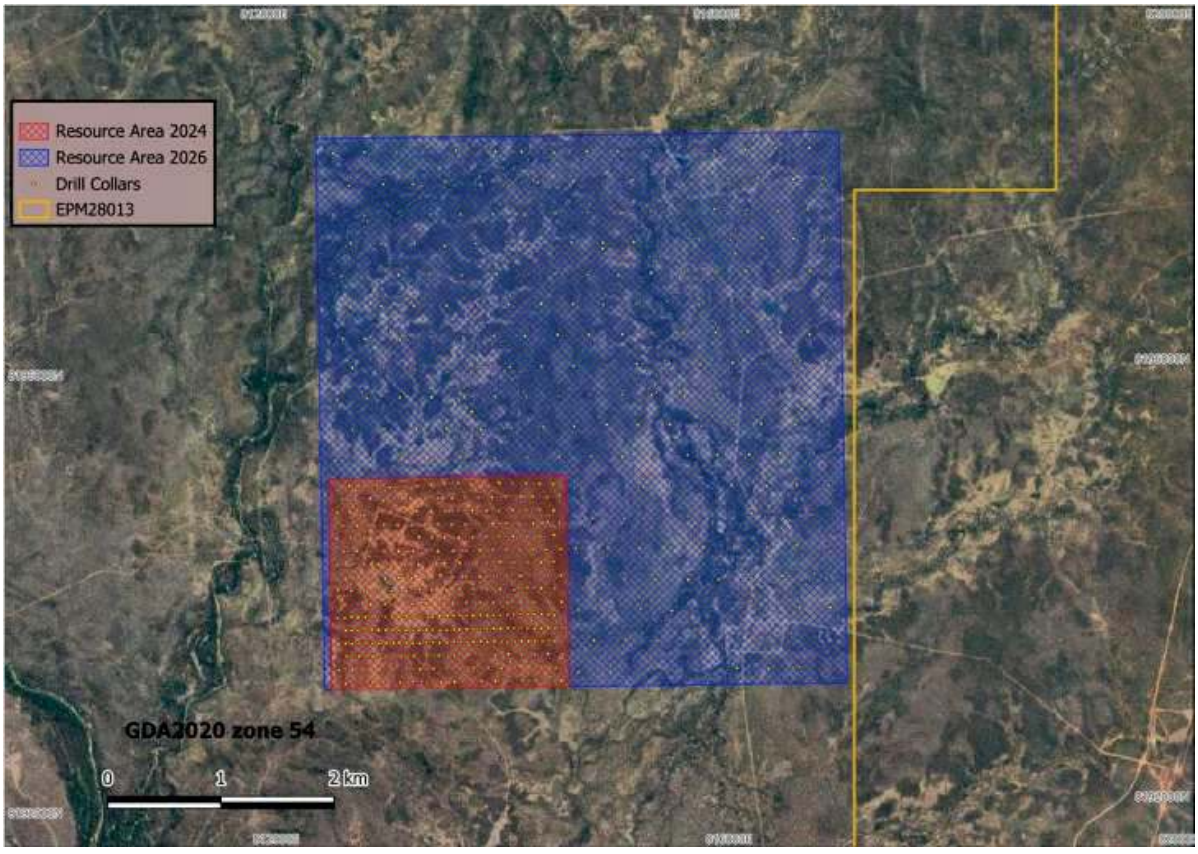

Figure 6: *Mineralisation interpretation areas from 2024 and 2026 with drill hole collars.*

For personal use only

The process of data preparation and compositing involved the following:

- Flagging the raw sample intervals within the database from the interpreted wireframe solids and numbering according to the individual elements. The individual element sample extraction data is listed below.
  - LODE 1: Sc
  - LODE 2: Y
  - LODE 3: La
  - LODE 4: Ce
  - LODE 5: Pr
  - LODE 6: Nd
  - LODE 7: Sm
  - LODE 8: Eu
  - LODE 9: Gd

  - LODE 14: Tm
  - LODE 15: Yb
  - LODE 16: Lu
  - LODE 17: Th
  - LODE 18: U
  - LODE 19: Zr
  - LODE 20: Hf
  - LODE 21: Nb
  - LODE 22: As
  - LODE 23: Ti
  - LODE 24: S
  - LODE 25: Ca
  - LODE 26: Sr
  - LODE 27: Pb
  - LODE28: Fe
  - LODE29: Mn
  - LODE30: Mg
  - LODE31: Al
- All drill holes were used in the interpretation and data extraction.
- Extraction & compositing the individual element values to 1m.

Statistics were conducted on each element dataset (Table 2) for the purpose of identifying outlier assays. Some elements required upper cutting as significant outliers were detected.

For personal use only

High-grade cutting involves identifying the point where continuity of the data is no longer consistent. The process uses histograms and probability plots. The high-grade cut-off values applied to the individual elements is shown in Table 3 with full histogram and probability plots available in Appendix 2:

8.0 VARIOGRAPHY

Variography and anisotropy was conducted on each element for the purpose of independent interpolation parameters and continuity for interpolation grouping. The main purpose of the variography is to define the anisotropy variables or search ellipse parameters. Major/Semi-major are ratios of the semi-major axis (vertical plunge component) to the major axis (lode azimuth), and Major/Minor ratio is the minor axis (lodes width) to the major axis (azimuth).

Due to consistency with many of the element anisotropies, 5 combined groups of elements were created for interpolation. In comparing the data to the May2024 resource evaluations, the new data is more consistent with all anisotropies returning a flat search. Some showed an orientation 90 to the main strike, though the semi-major axis ratio was close to one indicating a wide search, therefore the main orientation search will have no impact on the final result.

The average anisotropy and variography data was used in the interpolation for each group element.

Details of the anisotropy variable for each element group are shown in Table 4. Full details of the variography for each element is shown in Appendix 3.

Table 4: *Variography and anisotropy results for each element and groupings.*

9.0 BLOCK OPTIMISATION

Surpac macros were created to determine optimum block size, search distance and maximum samples within 2 element groups, Nd & Y. The process involves selecting a centre point between drill samples within the ore boundaries, creating a single block model, and graphically representing the Kriging efficiency and conditional bias slope. The optimal position is where the slopes are closest to one and each other. Block optimisation was adopted from the November 2024 datasets, due to the closer spacing of the drill holes in the area compared to the 2025/26 drill data. An optimisation was conducted in the larger drill space area to check for the number of samples and maximum search distance as the interpolation process moved from the closer spaced samples to the broader spaced samples.

The location for the block optimisation studies was conducted on Lode 2 (Yttrium) in the following locations:

- Close spaced drilling: Y=8193684 X=813866 Z=161.2
  - Maximum number of samples: 200
  - Maximum search distance: 200m
- Broader drilling: Y=8194287 X=813988 Z=163.8
  - Maximum number of samples: 150
  - Maximum search distance: 200m

The graphs of the studies can be viewed in Appendix 4.

For personal use only

10. 0 DENSITY

Ark conducted bilk density work during laboratory analysis at the following ratios for completed programs:

- May to June 2023 program: 1 in 3 samples was tested for gravimetric dry loose bulk density.
- December 2023 program: 1 in 3 samples was tested for gravimetric dry loose bulk density.
- August to September 2025 program: 1 in 4 samples was tested for gravimetric dry loose bulk density.

The database contains 1893 density measurements ranging from 0.48t/m³ to 2.41t/m³ with an average of 1.53t/m³. The density measurements are appropriate for tonnage estimation.

The data was interpolated into the model using a nearest neighbor algorithm.

For personal use only

11.0 BLOCK MODELLING

A block model was created in Surpac (version 6.6.2 x64) called:

"sandy_mitchel_model_aug2026.mdl"

The model uses Ordinary Kriging (OK) interpolation on the upper-cut datasets only.

The main interpolation process used Ordinary Kriging (OK) as the preferred algorithm. Kriging prevents over smoothing within the search parameters using mathematical inputs derived from the variography.

10.1 Block Model Parameters

The dimensions and parameters for the Sandy Mitchell models are listed in Tables 5 and model attributes are listed in Table 6.

Table 5: *Block model dimensions and attributes for the Main Model area.*

Type	Northing	Easting	Elevation
Minimum Coordinates	8193000	812300	115
Maximum Coordinates	8198200	817400	205
User Block Size	50	25	2
Min. Block Size	12.5	6.25	0.5
Rotation	0	0	0
Total Blocks	1507629

10.2 Interpolation Parameters

The raw elements identified in Section 7 under compositing were interpolated independently into the models using Ok, ID2 and OKcut.

The interpolation pass parameters used are as follows for all elements:

- Pass 1: 20-200 samples 200m max search
- Pass 2: 10-200 samples 400m max search
- Pass 3: 1-200 samples 800m max search.

Pass 3 was conducted due to a few outlier blocks not filled during pass 1 & 2. The unfilled blocks form part of the main interpretation and data continuity. Pass 1 & 2 did not fulfill the interpolation of the entire interpreted outlines due to the search ellipse limitations. The influence of this is inconsequential and will not impact on the final result or classification.

Additional elemental combinations and stoichiometric mineral formulas were mathematically calculated into the block model using provided formulas by Ark. Details of the economic mineral product formulas are outlined below. The calculated fields in ppm include: monazite, xenotime, zircon, rutile, hi_Ti_leucoxene, lo_Ti_leucoxene, altered_ilmenite, ilmenite, TREO, TREO+Y, LREO, HREO, CREO, MagREO & MzEq. The calculated fields in % include: garnet, muscovite, biotite, THM and TCM.

- MzEq ppm = (1.000 * monazite + 1.000 * xenotime + 0.361 * zircon + 0.281 * rutile + 0.165 * hi_Ti_leucoxene + 0.126 * lo_Ti_leucoxene + 0.072 * altered_ilmenite + 0.065 * ilmenite) + (0.058 * garnet + 0.026 * muscovite + 0.015 * biotite) * 10000
- Monazite ppm = (0 / 100 * Sc) * 3.1125 + (31.68 / 100 * Y) * 2.0682 + (99.27 / 100 * La) * 1.6837 + (99.17 / 100 * Ce) * 1.6778 + (99.6 /100 * Pr) * 1.6740 + (98.74 / 100 * Nd) * 1.6584 + (96.75 / 100 * Sm) * 1.6316 + (90.99 / 100 * Eu) * 1.6250 + (87.96 / 100 * Gd) * 1.6039 + (73.26 / 100 * Tb) * 1.5976 + (54.32 / 100 * Dy) * 1.5844 + (36.49 / 100 * Ho) * 1.5758 + (20.76 / 100 * Er) * 1.5678 + (9.84 / 100 * Tm) * 1.5622 + (5.27 / 100 * Yb) * 1.5488 + (3.10 / 100 * Lu) * 1.5428 + (64.20 / 100 * Pb) * 1.4583 + (98.98 / 100 * Th) * 1.4093 + (71.35 / 100 * U) * 1.3990 + (0.97 / 100 * Ca) * 3.3696 + (6.35 / 100 * Sr) *

11.0 METALLURGICAL TESTWORK

Ark conducted metallurgical testwork following encouraging results from initial exploration and to assist with next stage development.

The work conducted in 2024 by by Mineral Technologies Carrara Laboratory in Queensland, analysed on drill samples sourced from the deposit. The result of this test work concluded a final concentrate of 51.9% TREO, and contained mostly heavy rare-earth elements La, Ce, Pr and Nd, and direct CeO2 recovery from gravity feed to REM concentrate is estimated to be 71.7%.

It was noted that approximately 16.9% of Ce-minerals were stranded in laboratory test work intermediate streams which would normally be recycled in a continuous operation, thereby suggesting overall recovery of 83.8% may be achieved.

Additional metallurgical testwork conducted in August 2024 was Quantitative Automated Mineralogical Analysis conducted on Two Size Fractions of Composite Feed +2.85sg. A summary of the results was as follows:

- Two size fractions (+250 µm and -250 µm) of a sample labelled 'Composite Feed +2.85 SG' from the Sandy Mitchell Project were submitted for assay and QEMSCAN analysis.
- The sample is dominated by biotite (51.6 %), garnet (10.5 %) and 'goethite/limonite' 12.4 % which together account for 74.5 % of the sample.
- The elemental deportment data for titanium (Ti) indicates that 68.8 % of the Ti is contributed by biotite (spectral analysis of the QEMSCAN data estimates that the Ti content of the biotite is about 2 %).
- The investigation also found that a high proportion of the rutile through to ilmenite occurs in impure particles, mainly associated with silicates; only 4.5 % of the Ti occurs in clean Ti-rich particles.
- Similar data is presented in the report for:
    - Ce, La, Nd which is mainly hosted by monazite.
    - Y which is mainly hosted by xenotime with a lesser monazite contribution.
    - Zr and Hf which are exclusively contained in zircon.
    - The sample was submitted for LA-ICP-MS analyses of key mineral groups to confirm the compositions of the monazite, xenotime, and zircon and also to provide more information on:
    - the Pr, Sm, and heavy rare earth elements (HREE) (which are shown to be hosted by monazite).
    - the Yb (contributed by both xenotime and monazite).
    - the U (which is contributed by monazite, xenotime and zircon).
    - the Th (which is predominantly contained in monazite).

For personal use only

Ark conducted a scoping study metallurgical test program in 2025, conducted by IHC Mining (IHC), to study the detailed characterisation of the run-of-mine material and preliminary process tests to confirm the viability of potential treatment options and preparation of a flow sheet development scoping study.

IHC explored ways to create additional value from the project that allows them to reduce the required mining rate to 1,000-1,500tph. This included;

- Increase mineral recoveries
- Produce additional valuable products
- Improve final product quality to achieve higher product prices

The relative value of the ore is contained in muscovite, biotite, garnet, zircon, monazite and possibly ilmenite and rutile (Figure 7).

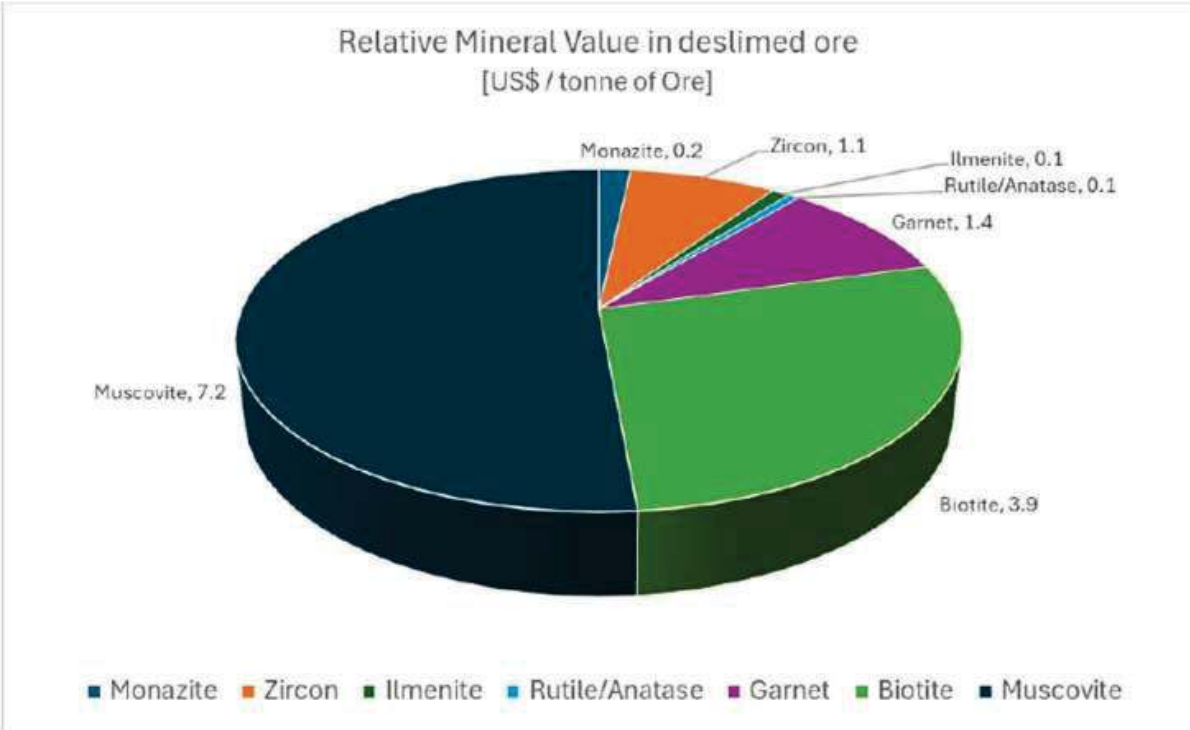

Figure 7: *Relative mineral value in the deslimed ore.*

The results of the Phase 1 testwork, the detailed characterisation of the run-of-mine material and preliminary process tests to confirm the viability of potential treatment options concluded the following.

- The sample provided for test work contains 0.043% total rare earth oxides (TREO) and 0.06% ZrO2.
- The mass distribution into the Heavy Mineral Fraction (HMF) of the as received ore is 4.1%
- based on the head feed and 6.0% based on the -2+0.045mm sandy fraction. The distribution of TREO into the HMF is 45.5% and 66.3% respectively. The distribution of

For personal use only

ZrO2 into the HMF is 51.5% and 69.9% respectively.

- The mass distribution into the +2mm oversize fraction is 9.0%. The losses of TREO and ZrO2 into this fraction are 4.3% and 3.7% respectively.
- Crushing of the +2mm oversize fraction to the 2mm top particle size results in the liberation and recovery of valuable minerals from this oversize rejects stream into the HMF:
    - An increase of TREO distribution into the HMF to 48.4% based on the head feed, and 71.6% based on the -2+0.045mm sandy fraction.
    - An increase of ZrO2 distribution into the HMF to 54.5% based on the head feed, and to 67.2% based on the -2+0.045mm sandy fraction.
- These values should be considered theoretical (maximally achievable) recovery levels for concentration of the deslimed sandy fraction on spirals. 5. However, crushing of the +2mm oversize fraction did not significantly change the mineral liberation/interlocking patterns of the resultant -2mm heavy mineral grains. This outcome is of particular interest for the size fraction -0.5mm+0.25mm:
    - The +0.5mm particle size fractions of the HMF contain negligible percentage of TREO and ZrO2, and may be considered a recoverable source of Garnet which is well liberated in these particle size fractions (preliminary grinding is not required).
    - The -0.5+0.25mm particle size fractions of the HMF contain valuable percentage of TREO, ZrO2 and Garnet. Garnet in this fraction is well liberated, Monazite is partly liberated and Zircon is fully unliberated. Preliminary grinding of this particle size fraction is recommended for assessment.
    - The -0.25mm particle size fractions of the HMF contain valuable percentage of TREO, ZrO2 and Garnet. All valuable heavy minerals in these particle size fractions are well liberated. Preliminary grinding of these particle size fractions is not required.
- The mass distribution into the LMF after oversize crushing is 69.7% based on the head feed and 92.4% based on the -2+0.045mm sandy fraction. The losses of TREO into the LMF are 19.1% and 28.4% respectively. The losses of ZrO2 into the LMF are 26.6% and 32.8% respectively. These values should be considered theoretical (minimal) for concentration of the deslimed sandy fraction on spirals.
- The mass distribution into the -0.045+0.010mm ultrafine sandy fraction of the as received ore is 9.2%. The losses of TREO and ZrO2 into this fraction are 20.7% and 17.0% respectively. Taking into account the distribution of TREO and ZrO2 into the -2+0.045mm HMF (71.6% and 67.2% respectively), the maximum recovery of these components from the -0.045+0.010mm fraction into the ultrafine HMF may be estimated at 14.8% and 11.4% respectively (based on head feed).
- Attrition scrubbing of the -2+0.045mm sandy fraction prior to wet gravity concentration is not required.
- Monazite is the main rare earth elements (REE) bearing mineral in the ore. The Crandallite group and REE oxides/carbonates are the other REE bearing mineral forms in the ore but REE distribution into these mineral forms is negligible.
- Zircon is the only ZrO2 bearing mineral in the ore.
- All Monazite in the Light Mineral Fraction (LMF) of the ore is deeply encapsulated in the form of ultrafine grains inside larger grains of silicates. Thus, grinding of the LMF for the purpose of liberation of Monazite does not make sense because such ultrafine liberated grains cannot be recovered by the conventional methods of mineral processing.
- Zircon is liberated for 9% and Garnet for 4% in the LMF. The losses of this liberated part of valuable minerals into the LMF seem to be related to their fine particle size. So, multi-

For personal use only

gravity (centrifugal) separation (MGS) of the finer particle size fractions of the ore (e.g. -0.5+0.025mm) is recommended for assessment. The Falcon-C technique seems to be the first choice in this case. At the same time, it should be noted that the use of an MGS technique for gravity separation of sandy fractions may result in an increase of the recovery of heavy Biotite into the Heavy Mineral Concentrate (HMC) which otherwise tends to be recovered into tails of spiral separators. The elevated percentage of Biotite in the HMC may create additional issues at the stage of subsequent mineral separation (MSP circuit).

- The Biotite processing tests have revealed a critical particle size cut point of 0.5mm. The mass percentage of magnetic Biotite (and most likely the other micaceous mineral forms) in the +0.5mm LMF is significantly lower compared to its percentage in the -0.5mm LMF fractions (0.8% versus 9.4% and 15.1% respectively). This suggests that fine screening of the ore at the cut points below 0.5mm will be problematic because of clogging of screen apertures by flaky grains of mica. Thus, separation of sandy fraction by particle size below this point should be done by hydraulic classification (e.g. up-current classification) rather than fine screening.
- Dry magnetic separation of the -0.5mm particle size fractions from spiral tailings is recommended for generation of a 30kg sample of Biotite concentrate within the planned test work Phase 2.
- Flotation may be considered a method of combined recovery of Biotite and Muscovite from the ore, if required.
- The QEMSCAN and QXRD techniques cannot be considered reliable methods of mineralogical analysis of Biotite concentrates. It is recommended to evaluate the grade of Biotite concentrates by a combination of optical microscopy (grain counting) and XRF analysis. It should be noted that grain counting may result in significantly higher percentages of Biotite in concentrates compared to instrumental methods.
- Wet high gradient magnetic separation (WHGMS) with the use of a conventional SLon-type vertical ring WHIMS technique may be effectively used for recovery of Monazite from -0.045mm slimes. However, further work is required to determine the appropriate magnetic field strength for separation of the low value mineral forms (e.g. magnetic iron oxides) from the high value Monazite into the nonmagnetic fraction. Associated mass and mineral recoveries can then be used to quantify the potential economic value to be created from the slimes stream.
- All stages of the planned test work Phase 2 can be performed in Australia.
- The method of abbreviated ICP analysis for Ce, La and Y may be considered a reliable inexpensive analytical method for assessment of process recoveries at the test work Stage 2.

The testwork confirms that REE mineral products meeting commercial grade thresholds can be produced from the Sandy Mitchell HMC without full-stream grinding, supporting the economic basis for the existing Mineral Resource Estimate.

The testwork re-prioritises the -0.5+0.15mm process circuit (from second to first priority) within the overall test program, given demonstrated production of saleable REE products without grinding of the full stream.

For personal use only

The TiO2 concentrate test work showed that a 73.5% TiO2 leucoxene product can be generated from the HM concentrate at the MSP stage, with contaminants within saleable limits.

The metallurgical assumptions underpinning the current Mineral Resource Estimate remain reasonable and consistent with Phase 2 Variation 1 results. Further testwork will be used to refine metallurgical factors in subsequent resource updates and feasibility studies.

Phase 2 report was unavailable at the time of writing.

For personal use only

12.0 CLASSIFICATION

The classification for this resource is conducted according to JORC 2012 guidelines. The resource has the 3 classifications, measured, indicated and inferred for the following reasons.

- The 3 programs conducted by Ark over the years have shown consistency in mineralisation and continuity in grade with 3 varying drill grid patterns of 100m x 50m, 100m x 100m staggered pattern and the current program of approximately 280m x 280m staggered grid. Variability in grade and mineralisation has rarely changed.
- Consistency of drilling data on a 100m x 100m staggered pattern is such that any infill drilling will have no impact on the structure or grade distribution. Mineralisation and interpretation is consistent throughout the drilling area.
- Quality control and quality assurance of the drilling was conducted to a high-level industry standard that can identify issues in drilling methods and laboratory assaying. There were no issues raised regarding the method of drilling, quality of the sampling or laboratory preparation and assaying.
- Collar pickups were conducted by a qualified surveyor.
- There is a strong recognition of geological controls on mineralisation.
- Variability in the grade distribution is sufficient to create quality variograms.
- A high degree of metallurgical understanding.
- Shallow mineralisation from surface indicates a simple and cheap mining method.

The classifications are therefore measured in the close spaced area of 100m x 100m of closer in the south-west corner and indicated in the remainder except for one small area where drilling could not be conducted due to pastoral issues (Figure 8).

13.0 MINERAL RESOURCE

The monazite equivalent (MzEq) value is considered the appropriate combination for reporting due to the potential to process the ore as a concentrate for shipment, therefore providing a more representative grade.

The Sandy Mitchell Mineral Resource is reported at a 1957ppm MzEq lower cut-off grade. The new Cut-off grade is based on the new extended mineral suite MzEq calculation and was determined by statistical analysis to isolate the mixed population of the left tail and truncate the low-grade tail, whilst honouring the geology and acting as an effective discriminator. The spatial correlation between the previous (700ppm MzEq) and new cut-off grade (1957ppm MzEq) is exact and the new cut-off grade of 1957 ppm MzEq yields the same geologically validated domain constraints.

Table 7: *Reported resource for Sandy Mitchell at a 1957ppm MzEq lower cut-off.*

MzEq Cut-off	Tonnes	Mzeq (ppm)	Alt Ilmenite (ppm)	Creo (ppm)	Hi Ti Leucoxene (ppm)	Ilmenite (ppm)	Lo Ti Leucoxene (ppm)	Magreo (ppm)	Monazite (ppm)	Rutile (ppm)

14.0 MODEL VALIDATIONS

The model was validated via the following:

1. Trend analysis plots. This is a graphical comparison of the drill data to the block data on even sections. The 2 sets of data should be relatively close to each other.
2. Visual data comparisons. This involves looking at the data in cross sections and comparing the drill assays to the block grades. The interpolated block data should trend similarly to the drill grades.

14.1 Trend Analysis Plots

The following figures 10 to 16 show trend comparison plots between the drill sample data and the interpolated block model data. The purpose is to show if any major discrepancies exist between the 2 data sets. The 2 sets of data should follow each other relatively closely.

This exercise was conducted on 6 elements being:

- OK1: Sc Scandium
- OK 10: Tb Terbium
- OK 11: Dy Dysprosium
- OK 12: Ho Holmium
- OK 13: Er Erbium
- OK 14: Tm Thulium
- OK 15: Yb Ytterbium

All 6 datasets show a close relationship and are considered acceptable for the resource.

14.2 Visual Data Comparisons

Visual comparisons were conducted to show the grade variations between the interpolated blocks and drill hole grades. This was conducted on Cerium (Ce) and Neodymium (Nd) in Figures 17 and 18. All other elements were visually checked. Due to the size of the model and distance between drill holes, images are kept to 2 for this report. Validation work in the November 2024 report displayed the same images and resulted in good comparisons The results show a close visual comparison and acceptable for this resource.

15.0 Field Trip

Andrew Hawker conducted a field trip on the 11th of November 2025 with an independent local Prospector and professional exploration Field Assistant, Corey Mills. The weather around 37° and humidity is 90%. Evening thunderstorms occurred though this did not restrict access. We travelled in 2 vehicles for safety reasons, staying overnight at Chillagoe.

A drone was used to assist in finding locations of interest and access.

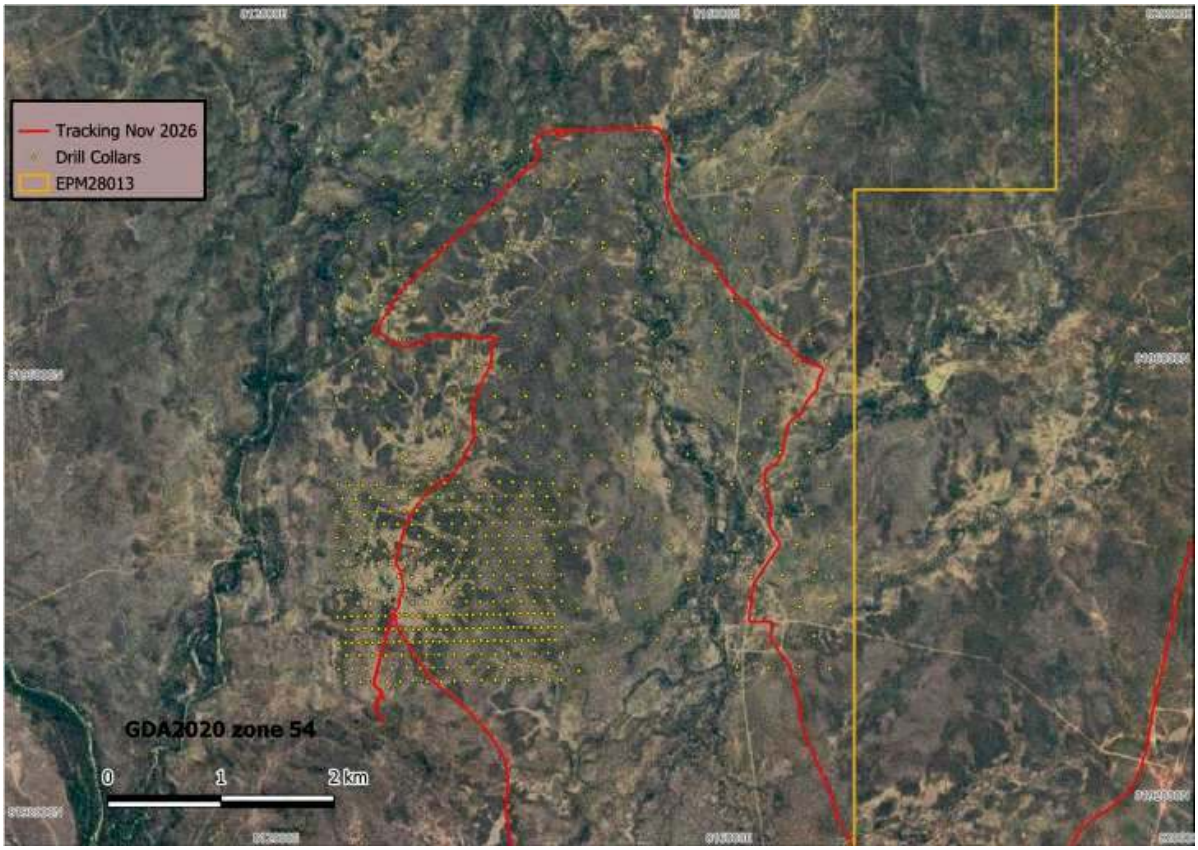

Figure 19: *Field trip tracking covering the drill area.*

The trip covered the area of drilling with a few areas stopped for assessment and running the drone to view from above.

To the south below the drilling the area starts to lift with a gentle slope allowing a general view of the region (Figure 20).

For personal use only

Drill holes were identifiable with metal stakes and hole identification markings (Figure 21).

Most of the drilling area was flat with signs of past rain wash (Figure 22). The bushland was low to moderate sub-tropical trees and shrubs.

Figure 20: *View from the south just off the drilling area looking north.*

For personal use only

Figure 21: *Hole 656 identifiable with a metal survey stake.*

Figure 22: *Drilling area was flat with signs of past rain wash.*

From above, the region to the south, where drilling is thicker, bushland has been cleared for drilling. There are no visible signs of the mineralisation potential from surface (Figure 23).

Figure 23: *Drone image taken in the south-west where drilling density is thicker.*

For personal use only

Drone image from the north shows thicker flora due to greater drilling grid. Land topography is flat (Figure 24).

Figure 24: *Drone image taken from the north looking south showing thicker flora within a flat terrain.*

Appendix A: JORC Code, 2012 Edition – Table 1

SECTION 1 Sampling Techniques and Data

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Sampling techniques	• *Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.* • *Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.* • *Aspects of the determination of mineralisation that are Material to the Public Report.* • *In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1 m samples from which 3 kg was pulverised to produce a 30 g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.*	Ark Mines May to June 2023 Sandy Mitchell programme sampling techniques: • Samples are rock chips and accompanying bulk fines collected on 1m intervals by air core drill using 100mm bit. • Sample was passed through an 82.5: 12.5 riffle splitter to yield a representative aliquot of approx. 1.5 kg collected in prenumbered calico bag, and a remainder retained in a numbered plastic bag, with recoveries volumetrically estimated with periodic checks by mass using digital scale, compared against laboratory loose bulk density measurements. • Historic works by SGS (SGS Oretest Job No: S0580, 2010 for JOGMEC) shows mineralisation to have grainsize < = 125µm (very fine sand) and thus the sample mass is adequate for representivity. • Sample for total digest assay was sent to North Australian Laboratories for Assay. • Sample for pan concentration was sub-sampled by spade channel through the remainder sample to a mass of approx. 1kg per metre as determined by digital scales. These were then panned to a concentrate and the subsequent concentrates composited per hole. • Pan Con composite samples were sent to IHC Mining where samples were screened to -1mm, heavy minerals were further separated by heavy liquid separation with yields weighed at each stage. • The final heavy mineral concentrate was subject to Portable XRF analysis for a limited indicative assay. • Samples for preliminary metallurgical testing were sent to Downer Mineral Technologies and comprised the entire bulk metre remainder after riffle splitting the representative aliquot and removal of the 1kg pan concentrate aliquot. Ark Mines November to December 2023 Sandy Mitchell programme sampling techniques: • All sampling methodologies were as per the June programme, but the air core bit was exchanged for a reverse circulation face hammer to complete the end of hole, at the same diameter. • The bedrock horizon was determined by geological chip logging supported by driller's run sheet records of penetration. Ark Mines December 2023 Sandy Mitchell auger programme:

Criteria	JORC Code explanation	Commentary
		• All sampling methodologies were as per the June programme, but the drilling was via 100mm auger using 105mm bit sampled on 1m intervals. • Bedrock was not intersected and depth was constrained by penetration. • No concentrate or metallurgical samples were produced Ark Mines August to September 2025 Sandy Mitchell programme sampling techniques: • All sampling methodologies were as per the November to December 2023 programme. • The bedrock horizon was determined by geological chip logging supported by driller's run sheet records of penetration and driller's statement of bedrock interception. • Sample for total digest assay were sent to NATA accredited Jinning Test and Inspection for Assay with methodologies matched to that of the previous programmes.
Drilling techniques	• *Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).*	Ark Mines May to June 2023 Sandy Mitchell programme: • Drill was by Comacchio track mounted air core rig using 100mm air core bit. • All holes were vertical and drilled to refusal or 17.5m, whichever came first. Ark Mines November to December 2023 Sandy Mitchell programme: • Drill was by AusRoc 4000 multi-purpose rig using 102mm and changing to slim line 102mm RC face hammer at depth. • All holes were vertical and drilled to complete the final metre in bedrock. Ark Mines November to December 2023 Sandy Mitchell auger programme sampling techniques: • Drilling was by Rockmaster utility mounted auger using 100mm flights and 105mm bit. • All holes were vertical and drilled to refusal whilst still in sands. Ark Mines August to September 2025 Sandy Mitchell programme: • Drill was by AusRoc 4000 multi-purpose rig using 102mm AC and changing to slim line 102mm RC face hammer at depth. • All holes were vertical and drilled to complete the final metre in bedrock.
Drill sample recovery	• *Method of recording and assessing core and chip sample recoveries and results assessed.* • *Measures taken to maximise sample recovery and ensure representative nature of the samples.* • *Whether a relationship exists between sample recovery and grade*	Ark Mines May to June 2023 and November to December 2023 Sandy Mitchell programme: • Recoveries were assessed by volumetric estimation by the metre based on total sample weights using a digital scale with comparison made via laboratory loose bulk density measurements.

For personal use only

Criteria	JORC Code explanation	Commentary
	and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.	• Sample was passed through a cyclone with a gated chute to allow fines to fall out of the air stream. The chute was kept closed until the end of each metre had been drilled, then opened to collect sample, and closed prior to recommencement of drilling. • No relationship between recovery and grade has been identified. Ark Mines November to December 2023 Sandy Mitchell auger programme sampling techniques: • Recoveries were not estimated and the samples with potential contamination by outside return, are treated as soils. Ark Mines August to September 2025 Sandy Mitchell programme: • Recoveries were assessed by volumetric estimation by the metre based on total sample weights using a digital scale with comparison made via laboratory dry loose bulk density measurements. • Sample was passed through a cyclone with a gated chute to allow fines to fall out of the air stream. The chute was kept closed until the end of each metre had been drilled, then opened to collect sample, and closed prior to recommencement of drilling. • No relationship between recovery and grade has been identified.
Logging	• *Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.* • *Whether logging is qualitative or quantitative in nature. Core (or costean, channel, etc) photography.* • *The total length and percentage of the relevant intersections logged.*	Ark Mines May to June 2023 and November to December 2023 Sandy Mitchell programme: • Sample was logged by the metre for all drilling, by the site geology team for both qualitative and quantitative criteria. • Drill logs for 100% of drilling are available with overall length of 3914.2m. • Logging is sufficient to support resource estimation, mining and metallurgical studies. Ark Mines November to December 2023 Sandy Mitchell programme sampling techniques: • Sample was logged by the metre for basic qualitative criteria only. Ark Mines August to September 2025 Sandy Mitchell programme: • Sample was logged by the metre for all drilling, by the site geology team for both qualitative and quantitative criteria. • Drill logs for 100% of drilling are available with overall length of 2330.5m, excluding 2 failed stubs for 4.3m which were redrilled. • Logging is sufficient to support resource estimation, mining and metallurgical studies.
Sub-sampling techniques and	• *If core, whether cut or sawn and whether quarter, half or all core taken.*	Ark Mines May to June 2023 Sandy Mitchell programme: • All sample passed through the drill cyclone dry.

For personal use only

Criteria	JORC Code explanation	Commentary
sample preparation	• *If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.* • *For all sample types, the nature, quality and appropriateness of the sample preparation technique.* • *Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.* • *Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second-half sampling.* • *Whether sample sizes are appropriate to the grain size of the material being sampled.*	• Sub-sampling for laboratory assay was by 87.5:12.5 riffle splitter: the bulk sample was passed evenly through the riffles with the assay aliquot collected in a pre-numbered calico bag, and the reject collected in a numbered plastic bag. • Field duplicates were taken at 1:40 by 50:50 riffle splitter. • Historic works by SGS (SGS Oretest Job No: S0580, 2010 for JOGMEC) shows mineralisation to have grainsize < 125µm (very fine sand) and thus the sample mass is representative. • Sample for pan concentration was sub-sampled by spade channel through the reject to a mass of approx. 1kg per metre as determined by digital scales. • Sample for preliminary metallurgical testing was selected from the 11m twinned hole SMDH 00014b and comprised the entire 87.5% bulk metre sample after riffle splitting to yield the representative sample and removal of the 1kg pan concentrate aliquot. Ark Mines November to December 2023 Sandy Mitchell programme: • All sampling was conducted as per the June 2023 programme, but duplicates at 1 in 40 were taken by passing the total reject sample through an 87.5:12.5 riffle splitter in the same manner as the primary sample. Ark Mines November to December 2023 Sandy Mitchell auger programme sampling techniques: • Sample was funnelled up by spiral flights through a closed steel collar tube, to a collector plate, then funnelled through a chute to a plastic collection tub. • Sub-sampling for laboratory assay was by 87.5:12.5 riffle splitter: the bulk sample was passed evenly through the riffles with the assay aliquot collected in a pre-numbered calico bag, and the reject was allowed to spill. • but duplicates at 1 in 40 were taken by passing the total reject sample through an 87.5:12.5 riffle splitter in the same manner as the primary sample. Ark Mines August to September 2025 Sandy Mitchell programme: • All sampling was conducted as per the November to December 2023 programme.
Quality of assay data and laboratory tests	• *The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.* • *For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times,*	Ark Mines May to June 2023 Sandy Mitchell programme: • Metre samples were sent to North Australian Laboratories (NAL) for total digest assay: • Samples were weighed then kiln dried and re-weighed. • 1 in 5 samples was tested for moisture content. • 1 in 3 samples was tested for dry loose bulk density. • Sample was then pulverization in an LM-5 to 94% passing 75 µm with assay aliquot selected by laboratory splitter.

Criteria	JORC Code explanation	Commentary
		gravity separation using Wilfley table (rougher stage). • The Wilfley concentrate was passed through a bromoform heavy liquid separation flask (cleaner stage). • The HLS sinks were attrition cleaned for 5 minutes at a 65% wet weight density and deslimed, then passed through a Geoteknica FM3 froth floatation cell using starch depressant and sodium silicate surfactant. • Both sinks and floats were separately processed through a dry induced Reading magnetic separator. • This yielded 4 final streams of mag and non-mag floats (containing the bulk of REE) and mag and non-mag sinks, containing the bulk of zircon, as well as various tails from each previous stage. • Percentages of material passing or rejecting at each stage were determined by mass. • The float magnetic fraction was further refined by semi-lift magnetic separator to determine feasibility of individual mineral species separation, but the yields of this process were not assayed due to volumetric limits from this round of processing. • Mineral Technologies sent samples of the tails and product concentrates, excluding SLM stage products, to Bureau Veritas Brisbane for assay: • Samples were dried and pulverised using tungsten carbide bowls in a vibrating pulveriser to 90% passing 75 µm with a BQF before each sample. • Sample was fused to a glass bead to determine Fe, Si, Al, Cr, Mg, Mn, P, U, Th, V, Nb, S, Ca, K, Ce, Sn, Ti, and Zr oxides by XRF. • LOI was determined by mass after heating to 105°C (drying temp) and 1000°C (fusing temp). • Ce, Dy, Er, Eu, Gd, Ho, La, Lu, Nd, Pr, Sc, Sm, Tb, Tm, Y and Yb were determined by laser ablation of fused bead with ICP-MS finish. • Standards were assayed at 1 in 3 to cover all elements in the suite for both assay methods. • Laboratory repeats were carried out at 1 in 4. Ark Mines May to June 2023 and November to December 2023 Sandy Mitchell programme: • Metre samples were sent to North Australian Laboratories (NAL) for total digest assay: • Samples were weighed then kiln dried and re-weighed. • 1 in 10 samples was tested for moisture content. • 1 in 10 samples was tested for LOI. • 1 in 3 samples was tested for dry loose bulk density.

		• Sample was then pulverization in an LM-5 to 94% passing 75 µm with assay aliquot selected by laboratory splitter. • Al, Ca, Cr, Fe, Mg, P, S, Si and Ti were assayed by sodium peroxide fusion in nickel crucibles with ICP-OES finish. • Sc, Y, La, Ce, Pr, Nd, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu, Th, U, Zr, Hf, Nb, Ta, Sr, Pb and As were assayed by sodium peroxide fusion in nickel crucibles with ICP-MS finish. • Na and K were assayed by 4 acid digest with ICP-OES finish. • Field duplicates were taken at 1:40 by 87.5:12.5 riffle split of the bulk reject. • For total digest samples: • Laboratory repeats were requested at no less than 1 in 40 but carried out by the laboratory at 1 in 8. • Standard insertion was carried out by the laboratory at 1 in 24. • Assay of blank quartz flushes was requested at 1 in 40. • Grind size testing was carries out at 1 in 34. • Total radiometric count, K%, U ppm and Th ppm was measured on all assay samples using an RSI RS-230 103 cm^3 bismuth germanate oxide crystal high sensitivity hand held spectrometer, purchased for the Project and, pre-calibrated. • Reading times were 30 second accumulations, with 20x30 second background accumulations taken per day, per measuring station, one set before and one set after measurement. Ark Mines December 2023 Sandy Mitchell auger programme sampling techniques: • Laboratory, analytical procedures, analytes and QC were identical to that described for the AC programme above. Ark Mines August to September 2025 Sandy Mitchell programme: • Metre samples were sent to Jinning Test and Inspection for total digest assay: • Samples were weighed then kiln dried and re-weighed. • 1 in 5 samples was tested for moisture content. • 1 in 4 samples was tested for dry loose bulk density. • Sample was then pulverization in an LM-5 to 95% passing 75 µm with assay aliquot selected by laboratory splitter. • Al, Ca, Cr, Fe, K, Mg, Mn, Na, P, S, and Ti were assayed by four acid digest with ICP-OES finish. • Sc, Y, La, Ce, Pr, Nd, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu, Th, U, Zr, Hf, Nb, Ta, Sr, Pb, As, Sn, W and Si were assayed by sodium peroxide fusion under agitation in nickel crucibles with ICP-MS finish.

For personal use only

Criteria	JORC Code explanation	Commentary
		• Field duplicates were taken at 1:40 by 12.5:87.5 riffle split of the total reject. • For total digest samples: • Laboratory repeats were assayed at than 1 in 12. • Standard insertion was carried out by the laboratory at 1 in 14. • Assay of blank quartz flushes was carried out at 1 in 40. • All raw assay and QAQC data including the typically unreported fusion calibration standards were sent to independent chartered analytical chemist Ray Wooldridge of Kurrason Pty Ltd for analysis with subsequent direct requests to Jinning for partial or whole batch refusing, further repeats, methodology updates and any other measures necessary to ensure the highest precision and consistency of results. • Final passed data was then databased and reported by Scion Consulting, independent mineral and met data consultant Dan Nicholson. • Reported assays were then validated against drill logs and analysed against each batch and against the maiden MRE data set by Empirical Earth Science. • These extra QC measures were emplaced by Ark to ensure the highest precision, accuracy and data compatibility after changing laboratories for this round of drill sample assaying.
Verification of sampling and assaying	• *The verification of significant intersections by either independent or alternative company personnel.* • *The use of twinned holes.* • *Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.* • *Discuss any adjustment to assay data.*	Ark Mines May to June 2023 and November to December 2023 Sandy Mitchell programme (including auger): • Significant intersections have not been separately determined or reported. • 11 twin holes have been drilled for a total of 104.85 twin metres Two of these twins are using power auger to twin air core, to support both resource and reconnaissance works. • Data was entered into MS excel then verified against hard copy data, followed by import into Datamine Studio RM for validation. • Primary data is stored as hard copy, electronic tables in CSV format and Datamine format. • Assay data yielding elemental concentrations for rare earths (REE) within the sample are converted to their stoichiometric oxides (REO) in a calculation performed using the conversion factors in the table below. • Rare Earth oxide is the industry accepted form for reporting rare earths. The following calculations have been used for reporting: • TREO = La2O3 + Ce02 + Pr6O11 + Nd2O3 + Sm2O3 + Eu2O3 + Gd2O3 + Tb4O7 + Dy2O3 + Ho2O3 + Er2O3 + Tm2O3 + Yb2O3 + Lu2O3+ Y2O3 • CREO = Nd2O3 + Eu2O3 + Tb4O7 + Dy2O3 + Y2O3 • LREO = La2O3 + Ce02 + Pr6O11

For personal use only

Criteria	JORC Code explanation	Commentary
		• HREO = Sm2O3 + Eu2O3 + Gd2O3 + Tb4O7 + Dy2O3 + Ho2O3 + Er2O3 + Tm2O3 + Yb2O3 + Lu2O3+ Y2O3 • MagREO = Pr6O11 + Nd2O3 + Tb4O7 + Dy2O3 • Where stated as +Y and or +Sc, the calculated values above have the addition of Y2O3 and or Sc2O3 • ND/Pr = Nd2O3 + Pr6O11 • TREO – Ce = TREO – CeO2 • %NdPr + NdPr/TREO • Economic heavy minerals, monazite, xenotime, zircon, rutile, ilmenite, garnet, muscovite and biotite are potentially marketable materials contained in the mineralisation as demonstrated by IHC pan concentrate, gravity and MSP work and Downer Mineral Technologies met and IHC Mining work to date. • Assay data yielding elemental concentrations for rare earths (REE), Zr, Hf, Ti, Pb, Ca, Sr, U, Th, As, Fe, Mn, Mg and Al within the sample are converted to their stoichiometric mineralogy in a calculation performed using the conversion factors in the table below. For elements that occur in more than one mineral, the proportions of occurrence in each were reported by SGS (SGS Oretest Job No: S0580, 2010 for JOGMEC) and the assayed element is assigned by a percentage determined by these proportion, into the appropriate mineral species. • The following calculated mineralogy has been used for reporting: • Monazite = (0 / 100 * Sc) * 3.1125 + (31.68 / 100 * Y) * 2.0682 + (99.27 / 100 * La) * 1.6837 + (99.17 / 100 * Ce) * 1.6778 + (99.6 /100 * Pr) * 1.6740 + (98.74 / 100 * Nd) * 1.6584 + (96.75 / 100 * Sm) * 1.6316 + (90.99 / 100 * Eu) * 1.6250 + (87.96 / 100 * Gd) * 1.6039 + (73.26 / 100 * Tb) * 1.5976 + (54.32 / 100 * Dy) * 1.5844 + (36.49 / 100 * Ho) * 1.5758 + (20.76 / 100 * Er) * 1.5678 + (9.84 / 100 * Tm) * 1.5622 + (5.27 / 100 * Yb) * 1.5488 + (3.10 / 100 * Lu) * 1.5428 + (64.20 / 100 * Pb) * 1.4583 + (98.98 / 100 * Th) * 1.4093 + (71.35 / 100 * U) * 1.3990 + (0.97 / 100 * Ca) * 3.3696 + (6.35 / 100 * Sr) * 2.0839 • Xenotime = (0.51 / 100 * Sc) * 3.1125 + (63.53 / 100 * Y) * 2.0682 + (0.01 / 100 * La) * 1.6837 + (0.04 / 100 * Ce) * 1.6778 + (0.11 /100 * Pr) * 1.6740 + (0.33 / 100 * Nd) * 1.6584 + (2.4 / 100 * Sm) * 1.6316 + (5.47 / 100 * Eu) * 1.6250 + (10.5 / 100 * Gd) * 1.6039 + (24.31 / 100 * Tb) * 1.5976 + (42.37 / 100 * Dy) * 1.5844 + (59.16 / 100 * Ho) * 1.5758 + (73.73 / 100 * Er) * 1.5678 + (83.07 / 100 * Tm) * 1.5622 + (85.42 / 100 * Yb) * 1.5488 + (85.38 / 100 * Lu) * 1.5428 + (0.19 / 100 * Pb) * 1.4583 + (0.62 / 100 * Th) * 1.4093 + (16.95 / 100

Criteria	JORC Code explanation	Commentary
		• Because other elements can occur in both xenotime and monazite, the calculation for these minerals should be considered the minimum. • Because Ti and to a lesser extent Zr, can occur in other minerals not included in calculation, the calculated mineralogy for these elements should be considered a maximum. This also applies to Fe, Mn, Mg, Ca and Al in garnet, and both micas. However, QEM Scan conducted by ALS in 2024 and supported by laser ablation ICP-MS grain assays conducted by CODES in 2024, have provided elemental deportments into each mineral species and these deportments have been used to calculate the percentage of the critical element that contributes to each mineral. Ark Mines August to September 2025 Sandy Mitchell programme: • Significant intersections have not been separately determined or reported. • 3 further twin holes were completed in addition to the previous 11 twins, two of which are stubs at less than full length. • Log data was entered into MS excel then verified against hard copy data, followed by import into Datamine Studio RM for validation. • Assay data was directly imported from the final lab reports into MS excel followed by import into Datamine Studio RM for validation. • Primary data is stored as hard copy, electronic tables in CSV format and Datamine format. • Assay with respect to oxides and mineralogy are as reported above for the Ark Mines May to June 2023 and November to December 2023 Sandy Mitchell programme, ie the same schema is applied throughout.
Location of data points	• *Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.* • *Specification of the grid system used.* • *Quality and adequacy of topographic control.*	Ark Mines May to June 2023 and November to December 2023 Sandy Mitchell programme: • An initial collar survey by hand held GPS was conducted as a failsafe, with expected accuracy of ±5000mm in x and y, and ±50000mm in z. • Full survey by Twine Surveys was subsequently carried out using RTKdGPS with accuracy of ±20mm in x and y, and ±200mm in z • Twine's professional RTK survey was implemented between drill collars and used to generate a digital terrain model for high quality topographic control. • All survey data is recorded in MGA 2020 zone 54 and AHD. Ark Mines December 2023 Sandy Mitchell auger programme: • Collar survey was by hand held GPS with expected accuracy of ±5000mm in x and y, and ±50000mm in z.

Criteria	JORC Code explanation	Commentary
		Ark Mines August to September 2025 Sandy Mitchell programme: • An initial collar survey by hand held GPS was conducted as a failsafe, with expected accuracy of ±5000mm in x and y, and ±50000mm in z. • Full survey by Twine Surveys was subsequently carried out using RTKdGPS with accuracy of ±20mm in x and y, and ±200mm in z • Twine's professional RTK survey was implemented between drill collars and used to generate a digital terrain model for high quality topographic control. • Survey data is recorded in MGA 2020 UTM zone 54.
Data spacing and distribution	• *Data spacing for reporting of Exploration Results.* • *Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.* • *Whether sample compositing has been applied.*	Ark Mines May to June 2023 and November to December 2023 Sandy Mitchell programme: • Data spacing for 3 lines of drilling is 60m x 120m. • Data spacing for the remaining 13 lines is 120m x 120m • No compositing has been applied to 1m samples for total digest assay. • Pan concentrates were composited per drill hole. • Preliminary metallurgical sample was composited as discussed under *Laboratory Tests.* • Representative metre samples for total digest assay were not composited, residual sub-metre hole ends were similarly assayed separately to preserve geometric representation. Ark Mines December 2023 Sandy Mitchell auger programme: • Data spacing was approx. 360m. • Representative metre samples for total digest assay were not composited, residual sub-metre hole ends were similarly assayed separately to preserve geometric representation. Ark Mines August to September 2025 Sandy Mitchell programme: • Data spacing for 18 lines of drilling is 280m x 2800m, staggered. • No compositing has been applied to 1m samples. • Variographic analysis of the May to June 2023 and November to December 2023 programme data shows the sample spacing and distribution is appropriate for geological and grade continuity to support future mineral resource estimation.
Orientation of data in relation to geological structure	• *Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.* • *If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this*	Ark Mines May to June 2023, November to December 2023 (including auger), and August to September 2025 Sandy Mitchell programme: • Deposit type is unconsolidated restite sand derived by in-situ weathering, sometimes called saprolite sand, with minor perturbation by small scale fluvial channels. • The applied vertical sampling is the optimal orientation for the deposit type. • No bias by orientation or spatial relationships has been identified.

For personal use only

Criteria	JORC Code explanation	Commentary
	should be assessed and reported if material.	
Sample security	• *The measures taken to ensure sample security.*	Ark Mines May to June 2023 and November to December 2023 Sandy Mitchell programme (including auger): • Samples were collected after logging and transported at the end of each day to the company locked storage in Chillagoe. • Samples were boxed in closed pumpkin crates, wrapped in plastic for shipping by courier to the laboratory in Pine Creek, NT. • Samples for IHC Mining and Downer Mineral Technologies were similarly boxed, wrapped and couriered to the laboratories, but prior to shipping were stored on site at the Ark fenced bulk bag farm. • Bagged reject was stored on site in Ark's fenced secure bag farm and covered in UV resistant tarping for future use except for auger samples where rejects were not collected. Ark Mines August to September 2025 Sandy Mitchell programme: • Samples were collected after logging and transported at the end of each day to storage on site, then periodically transported in bulk to the company locked storage in Chillagoe.
Audits or reviews	• *The results of any audits or reviews of sampling techniques and data.*	Ark Mines May to June 2023 and November to December 2023 Sandy Mitchell programme: • Full audit of sampling techniques and data available to date was carried out by geological consultants, Empirical Earth Science. • EES notes that the composited concentrate samples results in assay representing diluted material with no internal separation possible. • EES noted that the hand panning process of such fine material is prone to heavy mineral loss, with the possibility that concentrates underrepresent the total heavy mineral fraction. • ESS noted that the pXRF technique used in initial concentrate assays is not suited to yield full REE data, but that the results can inform approximate proxy calculations for the full REE suite. • EES noted that none of these factors apply to the representative metre samples and total digest assays, which meet best practice. • EES noted that the preliminary metallurgy was of insufficient volume and source dispersion to represent the entire eventual resource, but was well suited to its stated purpose of proof of concept, testing recovery technique, and process to inform the next stage of bulk metallurgy. • EES also noted that the preliminary metallurgy was selected by reviewing pan con composite results, representing a median grade material within that data set, and is thus a reasonable preliminary representation of grade and recovery performance.

For personal use only

Criteria	JORC Code explanation	Commentary
		• EES noted that the extensive QAQC was of good quality without significant bias, and showed that the data was fit for use in resource estimation. • EES noted that the auger data correlated within acceptable limits with the AC data and showed no undue bias or significant contamination, given the short hole depths, metre sampling and full QC suite. Ark Mines August to September 2025 Sandy Mitchell programme: • Full audit of sampling and logging techniques has been carried out by geological consultants, Empirical Earth Science. • Assay and QAQC data including the typically unreported fusion calibration standards were sent to independent chartered analytical chemist Ray Wooldridge of Kurrason Pty Ltd for analysis with subsequent direct requests to Jinning for partial or whole batch refusing, further repeats, methodology updates and any other measures necessary to ensure the highest precision and consistency of results • Further audits by EES are ongoing but no anomalies or systemic errors have been identified to date

SECTION 2 REPORTING OF EXPLORATION RESULTS

(Criteria in this section apply to all succeeding sections.)

Criteria	**JORC Code explanation**	**Commentary**
Mineral tenement and land tenure status	• *Type, reference name/number, location and ownership including agreements or material issues with third parties such as joint ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings.* • *The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.*	• EPM 28013 Sandy Mitchell is 100% owned by Ark Mines Limited and was purchased on the 23rd of February 2023. • This tenement was formally EPM18308. • There are no third party agreements. • No known issues impeding on the security of the tenure of Ark Mines ability to operate in the area exist. • A subsection of EPM 28013 was converted to mining lease ML 100409 on 15th October 2025 with an area of 405.57 ha encompassing the whole maiden MRE. • ML 100409 is subject to a landholder compensation agreement under Section 279 of the Mineral Resources Act 1989
Exploration done by other parties	• *Acknowledgment and appraisal of exploration by other parties.*	A number of companies and individuals have explored the area for gold and base metals and for heavy minerals. The summaries presented below are from the IRTM source: • ATP 597M was granted to Laskan Minerals Pty Ltd in 1969 over the Reid Creek area, north of the Mitchell River. From assays of rock chip and stream sediment samples, it was concluded that there was little chance of economic mineralisation occurring in the Authority. Although good monazite grades were obtained, the samples were from creeks with little available wash. Good concentrations of monazite

For personal use only

Criteria	JORC Code explanation	Commentary
		and ilmenite were present in large areas of sandy, alluvial sheet wash in the Reid's Creek area. It was believed that there was a potential for economic exploitation if the monazite concentrations occurred in a large enough volume of sandy material. No further work was reported. • In 1970, Altarama Search Pty Ltd was granted ATP 833M over the Mitchell River in the Reid Creek, Sandy Creek and Mount Mulgrave Homestead area. Four hundred stream sediment samples, at an average density of 1.25 samples/km^2, were collected for assay. Copper and lead contents were low. Half of the zinc results were considered to be possibly anomalous. A two population distribution was obtained for zinc, with a standard threshold of about 15 ppm. It was suggested that the two population distributions represented normal background ranges present in different strata. No other work was carried out. • ATP 2580M was granted to Tacam Pty Ltd over Sandy Creek and its tributaries. Stream sediment samples averaged 0.18% monazite (0.01 to 0.45%), 0.07% rutile (0.15% in terraces), and 0.06% zircon (0.14% in terraces). The area had low economic potential and the Authority was abandoned in August 1981. • The principals involved in Tacam Pty Ltd combined with Metcalfe Holdings Pty Ltd in 1986 to take up 4 Authorities to Prospect - 4400,4401,4402 and 4403 centred on Mt Mulgrave, Arkara Creek, Sandy Creek and the Kennedy River respectively. The investigations were for the possibility of locating large-scale heavy minerals in association with major drainages and lower slope eluvial deposits associated with Cretaceous weathering as indicated in previous investigations. EPM 4400, 4401, 4402 and 4403 • Barron and O'Toole focused on Mt Mulgrave for Ilmenite, rutile, REE, Monzonite, Zircon, and Gold.Tenement EPM 4400 consisted of 96 sub-blocks centred on Mount Mulgrave (7665, 7765), EPM 4401 consisted of 97 sub-blocks centred on Arkara Creek (7665), EPM 4402 consisted of 100 sub- blocks centred on Sandy Creek (7665) and EPM 4403 consisted of 86 sub-blocks centred on Kennedy River (7666, 7766) were granted to P.T.C. Barron, A. O'Toole and Metcalfe Holdings Pty Ltd on 22 September 1986 to explore for heavy minerals and precious metals. After three years

For personal use only

Criteria	JORC Code explanation	Commentary
		of exploration the EPMs were surrendered on 22 August 1989. • Tenement EPM 10185 consisted of 157 sub-blocks was granted to Palmer Gold Pty Ltd on 25 October 1994 for an initial 2 year period. The exploration permit was renewed for a further 3 years on 25 October 1996 and surrendered on 3 October 2001. The tenement was situated 200km west of Cooktown. Rationale Significant gold-silver, tin and base metal deposits are known from the Georgetown and southern Dargalong Inliers to the south of EPM 10185 (e.g. Etheridge, Croydon and Oaks goldfields), from the Hodgkinson Province to the east (e.g. Palmer, Hodgkinson, Russell River, Starcke, Jordon Ck, Mareeba and Mount Peter goldfields, and Herberton-Mt Garnet tinfield), and the Coen Inlier to the north (e.g. Alice River & Potallah goldfields). However, other than brief reference to sub-economic alluvial gold occurrences near the junction of the Palmer and Mitchell Rivers, and in the Staaten, Lynd and Walsh Rivers (Culpeper 1993), no precious or base metal deposits are known to occur within rocks of the Yambo Inlier. Application for the area was made after structural interpretation of the region showed prospectivity for gold occurrence. Base metal anomalies delineated from previous exploration were also targeted for follow-up work. • In 2007 exploration activity was carried out by BHP Billiton Minerals Pty Ltd under an extremely large area (2,850 sub-blocks) of the Coen Yambo area from 2005 to 2007. EPM's 14438 and 14445 covered the majority of the Yambo Inlier. BHP targeted Ni sulphide and PGM and carried out AEM surveying, field mapping and sampling and drilling. The AEM targets were found to be related to sedimentary lithological units or obvious shear zones. • In 2007 - 2009 - MTY Resources Ltd undertook bulk sampling program along with a Panned Concentrate sampling program. • In 2012 Waverley Nominees undertook an Augur sampling program. • Work after 2012 was carried out by Ark Mines Ltd and is detailed herein.

For personal use only

Criteria	JORC Code explanation	Commentary
Geology	• *Deposit type, geological setting and style of mineralisation.*	• The tenement covers a portion of the southern extent of the Yambo Inlier, one of the several Proterozoic inliers to the west of the Palmerville Fault System. Rocks of the Yambo Inlier covered by the tenement comprise those of the middle Proterozoic Yambo Metamorphic Group of mainly amphibolites and gneisses ranging in age from ~1690 Ma to ~1585 Ma. • The dominant Yambo member on the tenement is the Chelmsford Gneiss, and this is the source of REE sands. • These rocks have been intruded by Silurian-Devonian granites of the Lukinville Suite which form an integral part of the Cape York Batholith. Within the tenement they form a belt roughly 10 km wide trending NNW. • Extensive intrusions of Carboniferous-Permian dolerites occur throughout the Inlier, with only a few occurrences within the tenement. • The tenement appears largely gold deficient to date, except for the gold reporting to sediments within the Palmer River to the north. Recent Governmental radiometric surveys have highlighted areas of anomalous radiometric emission within the Yambo Inlier. The project tenements cover the majority of the anomalous radiometric areas. • The project area in the tenement has a 3 to 33m, average 10.0m (stage 3 & 4 drilling) to 12.3m (stage 2 drilling), covering of disaggregated fine to very fine sand with sparse pebble or cobble horizons. These sands carry REE as monazite and lesser xenotime, zircon, rutile, illmenite, garnet and micas. The sands are believed to derive from weathering of the Chelmsford Gneiss, with minimal fluvial transport largely constrained to the upper 2m. There is minor clay in the top 1 to 2m of sand which extends from daylight to the bedrock.
Drill hole Information	• *A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:* ○ *easting and northing of the drill hole collar* ○ *elevation or RL (Reduced Level – elevation above sea level in metres) of the drill hole collar* ○ *dip and azimuth of the hole* ○ *down hole length and interception depth* ○ *hole length.* • *If the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.*	• A full list of drilling information is listed ASX Announcement: Ark Mines Limited. 20 August 2026. *Sandy Mitchell Stage 3 Resource Expansion Drilling Results* [Progress Report], Ark Mines Limited; Sydney – Appendix B: Drill Data Table. • *https://asx.api.cmfyapp.com/asx-research/1.0/file/2924-03123521-2A1690691&v=undefined*

• Calculated mineralogy reduced by the deportment percentages (discussed and shown in Table 1 Part 1) is used to derive a monazite equivalent, which represents the economic heavy minerals proportional to their value

For personal use only

Criteria	JORC Code explanation	Commentary

(as determined by an analysis of extensive market data), with respect the concentration of monazite.

- The assayed elements, coupled with QEMSCAN element proportions in ALS Job No: *MIN6934*, 2024 for Downer Mineral Technologies, allow calculation of monazite, xenotime, zircon, rutile, high titanium leucoxene, low titanium leucoxene, altered ilmenite, ilmenite, garnet, muscovite and biotite concentrations stoichiometrically, as described in Table 1 Part 1
- The ratio of 5 year median values of these minerals to monazite, yields a table of unitless factors:

Mineral		Ratio
monazite		1.000
xenotime		1.000
zircon		0.361
rutile	TiO_2 > 95%	0.281
hi Ti leucoxene	TiO_2 > 85%	0.165
lo Ti leucoxene	TiO_2 > 70%	0.126
altered ilmenite	TiO_2 > 55%	0.072
ilmenite	TiO_2 > 50%	0.065
garnet		0.058
muscovite		0.026
biotite		0.015

- These factors are applied to the corresponding separate mineral concentrations in PPM for a given element assay, and the results are summed to give a monazite equivalent in PPM for that assay:

MzEq = 1.000 * monazite + 1.000 * xenotime + 0.361 * zircon + 0.281 * rutile + 0.165 * hi Ti leucoxene + 0.126 * lo Ti leucoxene + 0.072 * altered ilmenite + 0.065 * ilmenite + 0.058 * garnet + 0.026 * muscovite + 0.015 * biotite

- The basket of mineral concentrations is equated proportional to monazite concentration. These proportions are set by their respective average market values across the 2024 financial year, which was found to be well representative of the market data set from 2016 to date when outliers had been excluded as calculated using the Z test.
- The monazite equivalent purpose is to afford relative data and grade comparison and assessment as a concertation and does not directly represent actual product value. Its main benefit is simplification of interpretation of a complex data set and reduction of human error.
- THM % (Total Heavy Minerals) is a simple mineral summation used in the mineral sands industry and has

Criteria	JORC Code explanation	Commentary
		been adopted due to its familiarity. THM% is the unit invariant summation of monazite, xenotime, zircon, rutile, low Ti leucoxene, high Ti leucoxene, altered ilmenite, ilmenite and garnet. By convention it excludes the micas: THM % = (monazite ppm + xenotime ppm + zircon ppm + rutile ppm + hi_Ti_leucoxene ppm + lo_Ti_leucoxene ppm + altered_ilmenite ppm + ilmenite ppm)/10000 + garnet% • TCM% (Total Commercial Minerals) is a less common but still recognised simple mineral summation which allows capture of the micas along with the HM basket captured in THM%: TCM % = (monazite ppm + xenotime ppm + zircon ppm + rutile ppm + hi_Ti_leucoxene ppm + lo_Ti_leucoxene ppm + altered_ilmenite ppm + ilmenite ppm)/10000 + garnet % + muscovite % + biotite % • The cutoff grade is calculated on monazite equivalent (MzEq) which allows the value in the potentially saleable commodities to be tied together in a single calculation, and visible in the drill data in a single instance. • The cutoff grade applied is 1957 ppm MzEq which correlates to the mixed population low grade left tail of the grade distribution affected by the input of non-ore grade background element assay. This equates to a geological domain boundary, not an economic boundary.
Relationship between mineralisation widths and intercept lengths	• *These relationships are particularly important in the reporting of Exploration Results.* • *If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.* • *If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').*	• Ark Mines May to June 2023 and November to December 2023 Sandy Mitchell programme drill data shows no regular variation in REE distribution beyond the top 1m where obvious and avoidable fluvial action may result in some supergene enrichment or depositional dilution. • The mineralisation is essentially flat lying, and thus intercept width on the vertical holes drilled is at or approaching the geometric minimum width, which is optimal. • Consequently, only down hole length are reported and these are equivalent to true thickness. • These relationships hold true for the 2025 data, as would be expected for the same mineralisation system, as seen in logging and assay results.
Diagrams	• *Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.*	• Diagrams as appropriate accompany the report/announcement.

For personal use only

Criteria	JORC Code explanation	Commentary
Balanced reporting	• *Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.*	• A full list of drilling information is listed ASX Announcement: Ark Mines Limited. 20 August 2026. *Sandy Mitchell Stage 3 Resource Expansion Drilling Results* [Progress Report], Ark Mines Limited; Sydney – Appendix B: Drill Data Table. • *https://asx.api.cmfyapp.com/asx-research/1.0/file/2924-03123521-2A1690691&v=undefined*
Other substantive exploration data	• *Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.*	• All data material to this report that has been collected to date has been reported textually, graphically or both.
Further work	• *The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).* • *Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.*	• Ark plans further resource estimation based on the August to September 2025 drilling. • Ark plans further resource extension drilling to the north, west and south of the resource described in this report. • Ark plans further metallurgical test work on a larger sample basis, investigating several different techniques to determine optimal processing. This work commenced in 2025 with provision of a 2.25 DMt ROM grade sample and recharacterization by IHC Mining Yatala, followed by flow sheet development and commencement of full met test work programme in 2026. • Ark also plans pilot plant test work and prefeasibility studies. • Ark plans further drill testing works across the tenement.

SECTION 3 ESTIMATION AND REPORTING OF MINERAL RESOURCES

(Criteria in this section apply to all succeeding sections.)

Criteria	JORC Code explanation	Commentary
Database integrity	• *Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.*	• The database was created by HGS Australia for the purpose of conducting a resource evaluation. • The resource evaluation was conducted by HGS Australia

Moisture	• *Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.*	• Tonnages were estimated as dry basis
Cut-off parameters	• *The basis of the adopted cut-off grade(s) or quality parameters applied.*	• Univariate statistics were conducted. Upper cut determinations were conducted from histograms and probability plots.
Mining factors or assumptions	• *Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.*	• Resource economics identifies the probable lower cut-off to be 1957ppm MzEq • The resource is flat and exposes the surface to a max depth of 25.5m. The anticipated mining method will be either loader, excavator, continuous miner or dozer push. Blasting is not required. A large scale low cost mining method can be employed and all mineralisation will be considered for this evaluation.
Metallurgical factors or assumptions	• *The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part*	**Background and Scope** • Phase 2 metallurgical testwork (Variation 1) was conducted by IHC Mining (IHC) on a composite heavy mineral concentrate

Criteria	JORC Code explanation	Commentary
	of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.	(HMC) sample derived from Ark Mines' Sandy Mitchell project (EPM28013), North Queensland. The testwork comprised Tests T01–T17 and T101–T112 on the -0.15mm and -0.5+0.15mm HMC size fractions respectively. • The objective of Variation 1 was to evaluate an alternative processing flowsheet to further upgrade rare earth element (REE) products, particularly through triboelectrostatic separation, to achieve higher Total Rare Earth Oxide (TREO) grades. **Sample** • Variation 1 Metallurgical test samples were composited from representative drill hole material. Relevant drill data, refer to ASX: AHK 2 OCT 2024, Sandy Mitchell Measured Resource of 71.8Mt @ 1,732.7ppm MzEq, table in Appendix C: Sandy Mitchell Stage 1 complete assay return. • Representative sample was deslimed, wet gravity concentrated over shaker table and electrostatically separated by Currumbin Minerals. • Sample preparation was conducted by IHC Mining in accordance with standard laboratory protocols. Feed material was dried and weighed at each stage of the flowsheet, with mass distributions calculated by weighing of all products and tailings • Variation 1 testwork was conducted at bench scale. Scale-up factors and plant-scale variability have not yet been characterised and will be subject to further testwork including pilot plant studies. • The sample volume used is considered appropriate for the current stage of project development (proof-of-concept and flowsheet optimisation). **Test Methods** • Tests T01–T17 addressed the -0.15mm HMC fraction; Tests T101–T112 addressed the -0.5+0.15mm HMC fraction. • Separation stages applied: (1) Wet screening at 0.5mm and 0.15mm; (2) Dry RE drum magnetic separation (REDMS, 1–2 passes); (3) Wet shaking tables (up to 4 stages); (4) Dry induced roll magnetic separation (IRMS, 1–8 passes); (5) High tension roll separation (HTRS, 3 passes with nonconductor retreatment); (6) Heavy liquid separation (HLS) at 4.05 SG (applied to selected -0.5+0.15mm streams); (7) Tribo-electrostatic separation (Tribo-ESPS, 1–2 passes). • All mass distributions, XRF assays (TiO_2, ZrO_2) and ICP assays (Ce, Y, and full REE suite) were determined on product and tailing streams from each separation stage. • Assay methods: XRF for major oxides (TiO_2, ZrO_2, SiO_2, Fe_2O_3, Al_2O_3 and others); ICP-MS/ICP-OES for full REE suite (La, Ce, Pr, Nd, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu, Y), Th, U and trace elements. **Flowsheet Overview** • The Variation 1 flowsheet (IHC Project 2734) applied sequential separation stages to both the -0.15mm and -0.5+0.15mm HMC fractions, including: wet screening and drying; dry magnetic

Criteria	JORC Code explanation	Commentary
		separation (REDMS); wet shaking tables; induced roll magnetic separation (IRMS, multiple passes); high-tension roll separation (HTRS); heavy liquid separation (HLS) at 4.05 SG (applied to selected -0.5+0.15mm streams); and triboelectrostatic separation (Tribo-ESPS, applied to -0.15mm REE concentrate streams). **REE Product Grades and Mass** • Four final REE product/concentrate streams were generated: • -0.15mm REE product: 0.29% mass distribution, 20.6% Ce, TREO 54.8% — the highest-grade product achieved, produced via reverse magnetic separation followed by triboelectrostatic separation. • -0.15mm REE concentrate 1: 0.08% mass distribution, 15.3% Ce, TREO 41.3%. • -0.15mm REE concentrate 2: 0.08% mass distribution, 17.1% Ce, TREO 46.4%. • -0.5+0.15mm REE product: 0.23% mass distribution, 19.7% Ce, TREO 52.6%. • Combined total mass of all four REE product/concentrate streams is approximately 570 g (0.67% of head feed). The expected blended TREO grade of all four streams combined is approximately 52.2% TREO. **Key Metallurgical Findings** • Triboelectrostatic separation (Tribo-ESPS) was proven as an effective and preferred method for separating REE minerals from magnetically similar zircon in the -0.15mm fraction, achieving >54% TREO in the final REE product. This method is considered superior to wet gravity separation and flotation for this application. • Magnetic zircon (zircon with elevated magnetic susceptibility) was identified as the primary challenge limiting achievement of high-grade (>54% TREO) REE products. • The -0.15mm REE product (54.8% TREO) was achieved by combining "reverse" magnetic separation with triboelectrostatic separation of lower-grade (37–48% TREO) REE concentrates. • Triboelectrostatic separation may also be applicable to ultrafine (-0.045mm) particle size fractions, providing a prospective processing method for Sandy Mitchell ultrafine product streams. • Gravity separation of all -0.15mm product streams was conducted using wet shaking tables only (without HLS). HLS was applied to one -0.5+0.15mm product stream for operational efficiency. • Generation of saleable REE products from the -0.5+0.15mm HMC was demonstrated without requiring grinding of the entire fraction. Only selected final by-products may require grinding for improved mineral liberation and reprocessing. • Generation of a >70% TiO2 product within the -0.15mm process circuit was demonstrated, confirming potential for saleable titanium dioxide products. **Recovery of Cerium (Ce)**

For personal use only

Criteria	JORC Code explanation	Commentary
		• Overall recovery of Ce into the four REE product streams was 65.43% (42.63% from the -0.15mm fraction and 22.80% from the -0.5+0.15mm fraction). • Particle-size based Ce recovery was 70.79% in the -0.15mm process circuit and 58.36% in the -0.5+0.15mm circuit (reflecting lower mineral liberation in the coarser fraction). • These recovery levels are expected to be increased under plant conditions through recirculation of intermediate streams and/or grinding and reprocessing of selected -0.5+0.15mm final product streams. **REE Product Elemental Composition** • The -0.15mm REE product (highest grade, 54.8% TREO) contains: Ce 20.6%, La 10.0%, Nd 8.57%, Pr 2.31%, Sm 1.50%, Y 1.17%, Dy 3,527 ppm, Gd 8,460 ppm, Er 820 ppm, Eu 326 ppm. • Heavy rare earth oxide (HREO) content of the combined -0.15mm REE product streams is approximately 2.2%; medium REE oxides (MREO) approximately 0.5%; light REE oxides (LREO) approximately 49.8%; with Nd2O3+Pr6O11 approximately 12.8%. • Gangue mineralogy in the -0.15mm REE product includes: SiO2 26.2%, TiO2 5.17%, ZrO2 6.55%, Fe2O3 0.6%, with minor Al2O3, CaO, Cr2O3, HfO2. **Metallurgical Balance Summary (-0.15mm HMC)** • -0.15mm REE product: 1.56% mass, Ce distribution 49.71%, TREO 54.8%. • -0.15mm REE concentrate 1 + 2: 0.84% combined mass, Ce distribution ~18% combined. • -0.15mm HTRS conductors: 6.29% mass, TiO2 73.5%, high-grade titanium product stream. • -0.15mm IRMS nonmagnetics 1: 18.98% mass, ZrO2 48.9%, primary zircon stream. **Metallurgical Balance Summary (-0.5+0.15mm HMC)** • -0.5+0.15mm REE product: 0.30% mass (of -0.5+0.15mm HMC), Ce distribution 58.36%. • -0.5+0.15mm IRMS nonmagnetics 1: 3.74% mass, ZrO2 17.3%, primary zircon stream. • -0.5+0.15mm HTRS conductors 1 & 2: combined 0.48% mass, HTRS conductors 1 assays 37.1% TiO2 and conductors 2 assays 104,000 ppm Ce. **Recovery** • Recovery levels are considered conservative relative to expected plant-scale performance, as intermediate product streams that were retained as separate fractions in bench-scale testing would normally be recycled in a continuous plant operation. • Previous Phase 1 testwork (Mineral Technologies, 2024) indicated overall Ce recovery of approximately 71.7% (direct) to 83.8% (including recycling of intermediate streams). Phase 2 Variation 1 results are consistent with and build upon these findings. **Implications for Resource Reporting**

For personal use only

Criteria	JORC Code explanation	Commentary
		• The testwork confirms that REE mineral products meeting commercial grade thresholds can be produced from the Sandy Mitchell HMC without full-stream grinding, supporting the economic basis for the existing Mineral Resource Estimate. • The testwork re-prioritises the -0.5+0.15mm process circuit (from second to first priority) within the overall test program, given demonstrated production of saleable REE products without grinding of the full stream. • The testwork confirms the need to reassess production of saleable TiO2 products as part of the overall project processing strategy. The metallurgical assumptions underpinning the current Mineral Resource Estimate remain reasonable and consistent with Phase 2 Variation 1 results. Further testwork will be used to refine metallurgical factors in subsequent resource updates and feasibility studies.
Environmental factors or assumptions	• *Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.*	• No assessments have been made yet, an independent EIS is currently in planning.
Bulk density	• *Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.* • *The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences*	• The database contains 1893 density measurements ranging from 0.48t/m³ to 2.41t/m³ with an average of 1.53t/m³. • The data was interpolated into the model using a nearest neighbour algorithm

For personal use only

Criteria	JORC Code explanation	Commentary
	between rock and alteration zones within the deposit. • *Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.*	
Classification	• *The basis for the classification of the Mineral Resources into varying confidence categories.* • *Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).* • *Whether the result appropriately reflects the Competent Person's view of the deposit.*	• The classification for this resource is conducted according to JORC 2012 guidelines. HGS considers the resource to be sufficiently drilled to be classified as measured, indicated and inferred. The reasons are: • The 3 programs conducted by Ark over the years has shown consistency in mineralisation and continuity in grade with 3 varying drill grid patterns of 100m x 50m, 100m x 100m staggered pattern and the current program of approximately 280m x 280m staggered grid. Variability in grade and mineralisation has rarely changed. • Consistency of drilling data on a 100m x 100m staggered pattern is such that any infill drilling will have no impact on the structure or grade distribution. Mineralisation and interpretation is consistent throughout the drilling area. • Quality control and quality assurance of the drilling was conducted to a high-level industry standard that can identify issues in drilling methods and laboratory assaying. There were no issues raised regarding the method of drilling, quality of the sampling or laboratory preparation and assaying. • Collar pickups were conducted by a qualified surveyor. • There is a strong recognition of geological controls on mineralisation. • Variability in the grade distribution is sufficient to create quality variograms. • A high degree of metallurgical understanding. • Shallow mineralisation from surface indicates a simple and cheap mining method • The results reflect the competent person.
Audits or reviews	• *The results of any audits or reviews of Mineral Resource estimates.*	• No available
Discussion of relative accuracy/ confidence	• *Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative*	• The competent person has confidence in the interpretation with regards to accuracy for the classification announced. • The interpolation process was run ordinary Kriging. • Past resource work has included uncut kriging and inverse distance squared interpolations for comparison. This proved to be consistently close with minimal outlier high grades affecting the overall average grades. This was not conducted this time doe to the past reporting

For personal use only

Criteria	JORC Code explanation	Commentary
	accuracy and confidence of the estimate. • *The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.* • *These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.*

JORC Compliance Statement

The information in this report that relates to Exploration Results, is based on information compiled by Mr Daemon de Chaeney, a Competent Person who is a Member of The Australasian Institute of Mining and Metallurgy (3003799), and the Australian Institute of Geoscientists (8284). Mr de Chaeney is an employee of Ark Mines Ltd.

Mr de Chaeney has sufficient experience that is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and

Ore Reserves'. Mr de Chaeney consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

Executive Summary

In September 2025 Ark Mines completed the fourth stage of the grid drilling programme to inform a resource extension on the Sandy Mitchell Project. The Stage 4 AC RC programme drilled 2334.8m on 220 collars with an average depth of 10.7 m. Of these, two were failed stubs for 4.3m, which were redrilled.

The quality assurance measures applied to drilling and sampling were excellent and benefited from identification of procedural deficits in the Stage 1 programme.

The quality control measures applied to sample and assay were best practice and the resultant QC data affords comprehensive analysis of the assay set. The minor anomalies identifiable in the QC data are of small enough magnitude that they are not material.

The QAQC shows the assay data to be of good quality and fit for the purpose of estimating a JORC 2012 resource mode with good confidence.

Review of Ark Mines Stage 4 Quality Assurance Measures

In August to September 2025 AHK drilled a stage 4 programme aimed at resource extension. The programme comprised 220 AC holes with RC finish for 2334.8m, including two failed stubs for 4.3 m, leaving 218 productive holes.

- Drilling and sampling methodology were identical to Stage 2, including the use of the same drill by the same drilling company.
    - AEG's AusRoc 4000 multi-purpose rig with on board air.
    - Holes were drilled by air core with RC finish in bedrock.
- Drilling was on a 280m x 280m staggered pattern on 18 east west lines with all holes vertical and the Stage 4 pattern abutting the north and east side of the stage 1 and 2 drilling that informed the maiden MRE.
    - This Stage 4 spacing was determined by sensitivity analysis of the HGS Australia maiden MRE variography to yield a data density that could support indicated confidence classification.
- Stage 4 drill hole depth varied between a minimum of 2.3m to a maximum of 28m with a mean depth of 10.7m.
- Stage 4 mineral sand depth varied between a minimum of 1m to a maximum of 25m with a mean depth of 10.0m.
- The Stage 4 resource data set includes five stage 2 reconnaissance holes that fall within the Stage 4 drill pattern, and which were drilled with the same rig using the same techniques for both drilling and sampling in November 2023.
- Samples were collected by the metre via passing through a gated cyclone to a 12.5 : 87.5 riffle splitter to yield a representative sample per metre in a prenumbered calico bag.

For personal use only

- Duplicate sample at the 1 in 40 programme scheme rate were taken by passing the bulk reject through a 12.5 : 87.5 riffle splitter to yield the duplicate in a prenumbered calico bag, plus the reject recaptured in a numbered UV resistant green bag.
- Duplicate bags were of the same series as representative sample bags and recorded as duplicates, preserving duplicate anonymity to the lab.
- Samples were logged by the metre on site and drilling / sampling operations were under geological supervision.
- Assay was conducted by Lab West Jinning (a NATA certified Phenna Group facility):
    - Sc, Y, La, Ce, Pr, Nd, Sm, Eu, Gd, Tb, Dy, Ho, Er, Tm, Yb, Lu, Th, U, Zr, Hf, Nb, Ta, Sr, Pb, As, Sn, W and Si were assayed by sodium peroxide fusion in nickel crucibles under agitation, with inductively coupled plasma mass spectrometry (ICP-MS) finish.
    - Al, Ca, Cr, Fe, K, Mg, Mn, Na, P, S, and Ti were assayed by four acid digest with inductively coupled plasma optical emission spectroscopy (ICP-OES) or inductively coupled plasma mass spectrometry (ICP-MS) as appropriate for the element.
    - PPB Au, Pt and Pd by low level Fire assay with ICP-MS finish on second metre and last sand metre samples.
    - Gravimetric moisture was measured at 1 in 5.
    - Gravimetric dry loose bulk density was measured at 1 in 4.
- QAQC included:
    - Field duplicates at 1 in 40 by 12.5 : 87.5 riffle split of the total reject sample.
    - Lab repeats at 1 in 12.
    - Certified standards at 1 in 14.
    - Blanks at 1 in 40.
- Further QC measures included full analysis of all results by an independent analytical chemist and data management consultant, with all QA anomalies flagged back to the assay lab with required mitigating actions specified, including partial and whole batch re-fusing, re-reading and extra controls (used by the lab internally to control for fusion parameter variation), standards and repeats as necessary to maximise the quality of assay return accuracy and precision.
- Collar survey was by qualified surveyor using real time kinematic differential GPS (RTKdGPS) with precision in X and Y of 20mm, and precision in Z 200mm.
- High density infill survey between and beyond drill collars, include drainage channels, was carried out to allow high accuracy RTKdGPS digital terrain modelling approx. 450m beyond the acceptable interpolation perimeter of resource estimation.
- Final assay returns from Lab West Jinning were received 22nd July 2026 and the following analysis examines the QAQC results of Stage 4 sampling and assaying.

The QA measures emplaced in Stage 1 and 2 drilling align with this Stage 4 and have been previously reported. Stage 4 QA is more rigorous that that of earlier stages due to learning from the earlier results and analysis, as is the intent of QAQC, and due to Stage 4 being at greater spacing, thus requiring a higher degree of assurance in sample representivity and statistical relatedness to afford resource confidence can be drawn from the results.

Review of Ark Mines Stage 4 Quality Control Results

For personal use only

Quality control measure are the use of control samples and statistical analysis of assay results to ensure suitability and reliability of the assay results for their end purpose. In this case to yield assay to inform a JORC 2012 compliant resource model, estimation and report.

The quality control of Stage 1 and 2 drilling has been previously reported and is not revisited in this document.

Stage 4 Laboratory Repeats

173 lab repeats have been analysed and the results are presented in the form of scatter plots showing the correlation and dispersion of repeats to primary assays, and ranked half absolute relative difference plots (HARD), showing an empirical measure of scatter or imprecision in the data. It should also be noted when assessing the HARD plots that the instrumental accuracy of the MS is ±10% which is generally between the 2nd and 3rd standard deviation, this is relevant to comparing the HARD data to certified reference material results. Results are presented in the **Laboratory Repeats Stage 4 Graph Matrix.**

The results are very good across the board with greater spread in the incompatible REE elements, many of which are present at low detection where analytical precision is objectively worse. Outliers exist but at very low quantity and there is a small general bias against the repeat which is largely dominated by outliers. This reflects the random nature of repeat selection rather than post selection based on grade distribution and is not considered to reflect a real bias in results.

Sc and Pb show the greatest scatter. In Sc which has a very minor contribution to resource, this reflects the difficulty in obtaining high precision assay of the element. The result is still considered to be good and the HARD plot indicates high data quality. Pb is not a problematic element to assay and its scatter is thought to represent a true inhomogeneity at the sample mass. The HARD is still well conditioned and given its very minor contribution to the resource, the data representivity is still very good.

Overall, the repeats show both precision and accuracy of lab preparation and assay is of very high quality and fit for purpose. The quality of repeats also directly points to high quality lab hygiene.

Stage 4 Field Duplicates

58 lab blind field duplicates have been analysed and the results are presented as scatter plots and HARD plots in the **Field Duplicates Stage 4 Graph Matrix.**

Field duplicates are split at lower precision and far greater particle size than ground and homogenised lab repeats, and it is normal for a concomitantly greater degree of scatter. Duplicates show the degree of variability in the sample under the given sample protocol; giving a measure of the fitness of the sampling procedure, independent of inherent assay noise and hygiene.

The dispersion seen in Sc is well aligned to that of the lanthanides and considering the repeat scatter is superimposed on the duplicate scatter, the graphs show that sample representivity is good for this element.

For personal use only

For personal use only

This trend is seen for all elements except Pb, with HARD plots more akin to most analytical labs repeats, and well above the repeatability levels seen in earlier programmes which were themselves, still acceptable. Pb is still strongly auto-correlated but shows by far the highest scatter with a HARD plot indicative of a low level element with a 'nuggety' distribution. As, also a very minor element in its contribution to resource, mirrors the behaviour of Pb to a lesser extent and given the chalcophile affinity and environmental mobility of As and Pb, this likely reflects geochemical inhomogeneity in both protolith rock and subsequent supergene mobilisation in this highly oxidised residual material.

Overall, the duplicates show that sample representivity is very good and the sampling protocol is well conditioned for the mineralisation. Sampling is shown to be fit for purpose.

Stage 4 Blanks

61 blank quartz flushes have been reviewed but as expected for a wide element spread of this nature, including all the incompatible elements which by nature become concentrated in late stage fluids, none are truly blank. This problem was also present in earlier stages of work since not even high cost engineered materials are blank across such a broad element suite. Blanks all show low levels of all elements, except Si, but in every case are well below the assay values of preceding or subsequent sample assay. Nevertheless, they are not suitable for diagnosing lab hygiene though they are suitable for enforcing it in the case of mill ring scouring.

In the manner of Stages 1 and 2, lab hygiene is best analysed by lab repeat scatter which is exemplary. Blanks graphs have not been included.

Certified Reference Materials

Thirteen different CRMs have been used, with multiple different CRMs distributed in the sample stream of each assay batch. The purpose of CRMs is to monitor assay bias, precision and accuracy. The five CRMs with the highest usage rates have been included in this report, since all 13 represent an impractically large amount of data. The included CRMs are:

- OREAS 462, a high grade standard**,** see **CRM OREAS 462 Stage 4 Graph Matrix**
- OREAS 460B, a medium grade standard, see **CRM OREAS 460B Stage 4 Graph Matrix**
- OREAS 460, a medium grade standard, see **CRM OREAS 460 Stage 4 Graph Matrix**
- OEAS 680, a low grade standard, see **CRM OREAS 680 Stage 4 Graph Matrix,** and
- OREAS 461 a lower high grade standard, see **CRM OREAS 461 Stage 4 Graph Matrix**

OREAS 462 is well representative of the upper grade bands of the mineralisation. There are few outliers and most are within the first standard deviation, with only one approaching the third standard deviation. This does not apply to Sc and As which this standard is not certified for, and the results of these reflect

standard scatter, not assay scatter. No systematic bias is seen and the standard shows at high grades the analytical technique is both precise and accurate.

OREAS 460B is well suited to represent the medium grade bands of the mineralisation. There are few outliers and only two that approach the third standard deviation. This standard shows that Sc and assays conform well. There is a small pattern of systematic bias in Hf. This type of sigmoid noise is often characteristic of thermal gradient related dissolution during fusion, but the accuracy and precision in Hf remain acceptable and are otherwise excellent across the element suite.

OREAS 460 is another medium grade band standard comparable to 460B. It is not certified for Sc and As and the graphs for these elements are indicative rather than diagnostic. There are few outliers: One in Ce assay may be considered a failure but is not validated by the other standards in the batch and is more likely a CRM failure rather than an analytical failure. Most other outliers are low rather than high, and the spread on this standard is far tighter than the same standard in Stages 1 and 2, though Ark notes that this CRM has always produced lower quality results than other CRMs in the same conditions and the standard itself is of suspect quality. The analysis is considered precise and accurate.

OREAS 680 is a low grade standard and many element concentrations approach the technique detection limit where analytical precision is instrumentally degraded. There are multiple outliers which are predominantly low, the majority are still within 1 to 2 σ with few excursions beyond this. There is more spread in Hf and Zr than most other elements and this standard is not certified for these elements, indicating the result is inherent in the CRM material. The sigmoidal fusion systematic bias is visible in several elements in the earlier runs, but this does not introduce a true analytical bias so much as an instantaneous precision degradation. Overall, the results are sufficiently precise and accurate.

OREAS 461 is well behaved and shows good precision and accuracy across the board with no systematic bias. Sc and As are not certified in this CRM and their results are only indicative.

Divergence in behaviour of the various standards in the same analytical batch derives from two sources; differing analytical performance across the grade range, this is an unavoidable feature of all analytical techniques; differing fusion uptake of differing CRM matrix materials, fusion parameters were optimised for the Sandy Mitchell sample type, but wide band REE CRMs have limited availability and several are derived from widely divergent mineralisation sources.

Overall, the standards individually and combination show that no deleterious bias is present and both precision and accuracy is very good and fit for purpose.

Conclusion

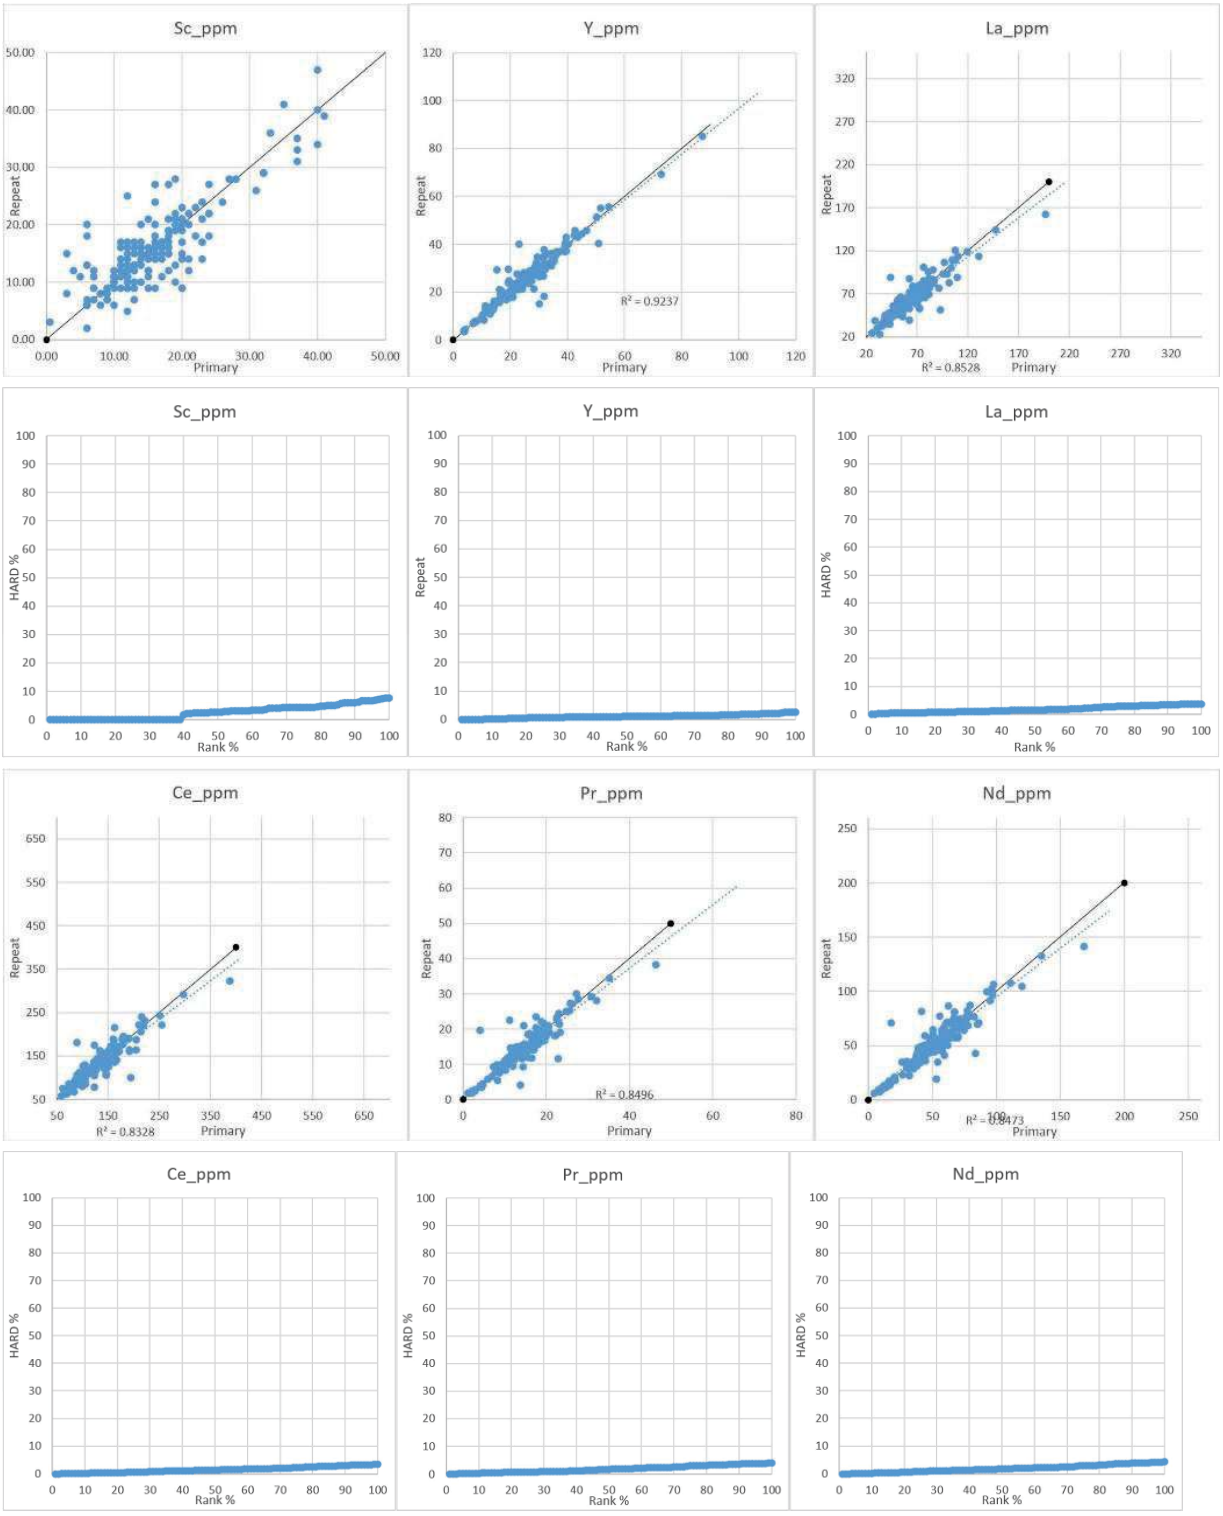

Analysis of Ark's Stage 4 Sandy Mitchell assay and sampling QAQC data shows:

- Sample quality is appropriate to the style and particle size of the mineralisation.
- Sample protocols are of high quality and yield consistent repeatable results.
- No systemic down hole contamination or sample hygiene problems are detectable.
- Assay precision is good across the grade range.
- Assay accuracy is good across the grade range.
- No material analytical bias is present in the data set.
- No lab hygiene problems are present.
- Minor elements Pb and As show elevated scatter indicative of geological distribution and supergene mobility, but are still sufficiently well behaved for use in their context.
- Blank assays are not materially useful as a preparation hygiene control in an assay suite of this diversity, but were carried out as a broadly diagnostic tool.
- The QAQC procedures, frequency and types are at or exceed best practice and provide total data set coverage.

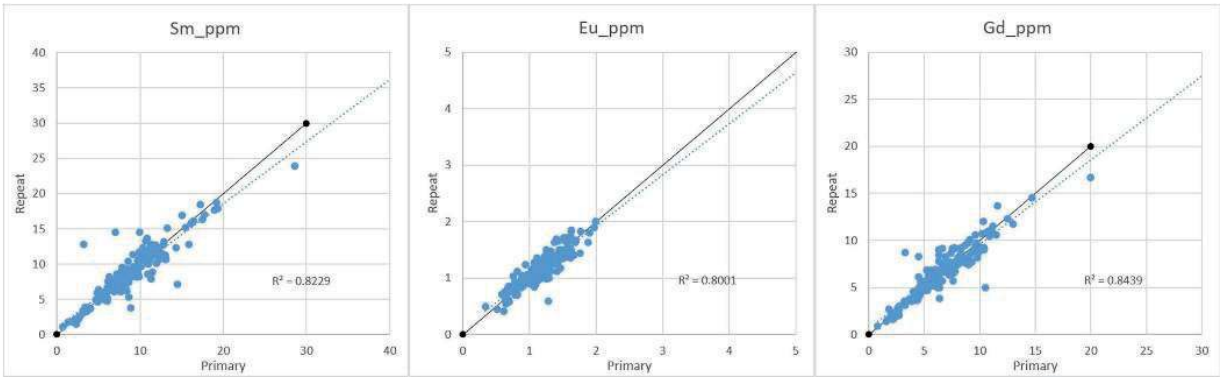

The assay data set is of high quality and the QC data is sufficient to warrant high confidence in the assay data. The Stage 4 assay data is representative of the mineralisation and sufficiently accurate to inform a JORC 2012 resource model over greater spacing and lower sample representation, with good confidence.
