

30 September 2026

## Annual Mineral Resource and Ore Reserve Statement

Black Cat Syndicate Limited ("**Black Cat**" or "**The Company**") is pleased to provide its annual Mineral Resource and Ore Reserve Gold update as at 30 June 2026. The updated estimates incorporate mining depletion from operations at Paulsens and Kal East, reflecting Black Cat's transition from developer to producer.

### HIGHLIGHTS

- Group Mineral Resources of 2.31Moz Au comprising 30.3Mt @ 2.4g/t Au across Black Cat's 100% owned Paulsens, Kal East and Coyote operations / project.
- Group Ore Reserves of 272koz Au, comprising 5.3Mt @ 1.6g/t Au across Paulsens and Kal East gold operations.
- Paulsens underground updated Mineral Resources of 2Mt @ 5.4g/t Au for 349koz maintains significant opportunity for life extension with high grade feed.
- Kal East retains a substantial 1.22Moz Mineral Resource providing a large inventory surrounding Black Cat's 100% owned Lakewood Processing Facility.
- Updated Fingals Fortune and Majestic Mineral Resources incorporate additional drilling and mining exposure, resulting in revised geological interpretations that better reflect the observed mineralisation.
- Initial Imperial Open Pit Ore Reserve of 32koz @ 1.4g/t Au added to the Kal East inventory.
- Updated geological interpretations across key Mineral Resource models have resulted in lower grades but increased confidence in the tonnes and grades underpinning future mine plans.
- Significant growth potential is not yet reflected in the current inventory, including recent discoveries at Lynx and Regulus at Paulsens, with increased drilling planned to test extensions, grow and upgrade Resources.

#### Group Mineral Resources

| Measured Resource |          |           | Indicated Resource |          |           | Inferred Resource |          |           | Total Resource |            |              |
|-------------------|----------|-----------|--------------------|----------|-----------|-------------------|----------|-----------|----------------|------------|--------------|
| Tonnes            | Grade    | Metal     | Tonnes             | Grade    | Metal     | Tonnes            | Grade    | Metal     | Tonnes         | Grade      | Metal        |
| ('000)            | (g/t Au) | ('000 oz) | ('000)             | (g/t Au) | ('000 oz) | ('000)            | (g/t Au) | ('000 oz) | ('000)         | (g/t Au)   | ('000 oz)    |
| 13                | 2.4      | 1         | 13,791             | 2.6      | 1,158     | 16,522            | 2.2      | 1,153     | <b>30,326</b>  | <b>2.4</b> | <b>2,312</b> |

#### Group Ore Reserves

| Probable Reserve |          |           | Total Reserve |            |            |
|------------------|----------|-----------|---------------|------------|------------|
| Tonnes           | Grade    | Metal     | Tonnes        | Grade      | Metal      |
| ('000)           | (g/t Au) | ('000 oz) | ('000)        | (g/t Au)   | ('000 oz)  |
| 5,262            | 1.6      | 272       | <b>5,262</b>  | <b>1.6</b> | <b>272</b> |

**Table 1:** 30 June 2026 Group Gold Resource and Reserves.

Mineral Resources are inclusive of Ore Reserves and include Inferred Mineral Resources.

#### Black Cat's Managing Director, Chris Stone, says:

"This annual update reflects Black Cat's transition from developer to producer, with our Mineral Resources and Ore Reserves now incorporating mining depletion from operations at Paulsens and Kal East.

We retain a substantial 2.31Moz Resource base and 272koz of Ore Reserves, providing a strong foundation for continued production. We can also see the significant potential for further growth existing. Recent discoveries at Paulsens Lynx and Regulus which are not yet accounted for in these estimates are examples of this.

FY27 will see a pivot to a significant increase in drilling across our operations, with a clear focus on testing the known potential, extending and upgrading Resources, and thereby underpinning our future mine plans and longer mine life."

## Material Resource Ounce Changes

Global Resources reduced by 7% from 2,480koz to 2,312koz, with 75% of this reduction coming from mining depletion and 25% from Resource updates.

Overall gold grades at Paulsens and Kal East have reduced compared to previous mineral resource estimates which is primarily a result of updated geological models. The updated models provide a higher confidence basis for future mine plans.

The cash generated in FY26 was strategically invested in the acquisition and upgrade of the Lakewood processing facility, and the Majestic and Fingals mining development to access ore. The opportunity in FY27 is to focus on funding a Resource and Reserve conversion programme. Black Cat has released to the market a Discovery & Growth Strategy document for FY27 that emphasises and details further the renewed focus on existing Resources and potential conversion opportunities.

Resource variance by category is as follows:

- **Kal East Mining Depletion:** -77koz total Resource material mined from Myhree, Boundary, Fingals, and Majestic.
- **Paulsens Mining Depletion:** -48koz total Resource material mined from Paulsens.
- **Kal East Resource Update:** -5k oz with Majestic Open Pit and Trojan Open Pit Resource changes.
- **Paulsens Resource Update:** -38koz relates to improved resolution on the extent of barren dolerite dykes and complexity of high-grade structures.

**Figure 1:** Resource variance FY25 / FY26 waterfall chart

Material Reserve Ounce Changes

Global Reserves reduced by 18% from 330koz to 272koz reflecting changes primarily to the Resources, mining depletion, and the addition of initial Open Pit Reserves at Imperial.

Reserve variance by category is as follows:

- **Kal East Mining Depletion:** -68koz Reserve material mined from Myhree, Boundary, Fingals, and Majestic.
- **Paulsens Mining Depletion:** -6koz Reserve material mined from Paulsens.
- **Kal East Reserve Adjustment:** 40koz added primarily at Imperial and Majestic.
- **Paulsens Reserve Adjustment:** -24koz reduction relating to an overall -57koz Resource adjustment.

**Notes on Resources:**

1. The preceding statements of Mineral Resources conform to the 'Australasian Code for Reporting of Exploration Results Mineral Resources and Ore Reserves (JORC Code) 2012 Edition'.
2. All tonnages reported are dry metric tonnes.
3. Data is rounded to thousands of tonnes and thousands of ounces gold. Discrepancies in totals may occur due to rounding.
4. Resources have been reported as both open pit and underground with varying cut-offs based off several factors discussed in the corresponding Table 1 which can be found with the original ASX announcements for each Resource.
5. Resources are reported inclusive of any Reserves.

**Kal East Gold Operation**

- Boundary, Trump, Myhree – Black Cat ASX announcement on 9 October 2020 "Strong Resource Growth Continues including 53% Increase at Fingals Fortune"
- Strathfield – Black Cat ASX announcement on 31 March 2020 "Bulong Resource Jumps by 21% to 294,000 oz"
- Sovereign – Black Cat ASX announcement on 11 March 2021 "1 Million Oz in Resource & New Gold Targets".
- Imperial – Black Cat ASX announcement on 29 June 2026 "Increased Resource at Trojan and updated Imperial".
- Jones Find – Black Cat ASX announcement 04 March 2022 "Resource Growth Continues at Jones Find"
- Crown – Black Cat ASX announcement on 02 September 2021 "Maiden Resources Grow Kal East to 1.2Moz"
- Fingals East – Black Cat ASX announcement on 31 May 2021 "Strong Resource Growth Continues at Fingals".
- Trojan – Black Cat ASX announcement on 29 June 2026 "Increased Resource at Trojan and updated Imperial".
- Queen Margaret, Melbourne United – Black Cat ASX announcement on 18 February 2019 "Robust Maiden Mineral Resource Estimate at Bulong"
- Anomaly 38 – Black Cat ASX announcement on 31 March 2020 "Bulong Resource Jumps by 21% to 294,000 oz"
- Wombola Dam – Black Cat ASX announcement on 28 May 2020 "Significant Increase in Resources - Strategic Transaction with Silver Lake"
- Hammer and Tap, Rowe's Find – Black Cat ASX announcement on 10 July 2020 "JORC 2004 Resources Converted to JORC 2012 Resources"

**Coyote Gold Operation**

- Coyote OP&UG – Black Cat ASX announcement on 16 January 2023 "Coyote Underground Resource increases to 356koz @ 14.6g/t Au – One of the highest-grade deposits in Australia"
- Sandpiper OP&UG, Kookaburra OP, Pebbles OP, Stockpiles, SP (Coyote) – Black Cat ASX announcement on 25 May 2022 "Coyote & Paulsens High-Grade JORC Resources Confirmed"

**Paulsens Gold Operation**

- Belvedere UG – Black Cat ASX announcement on 21 November 2023 "Enhanced Restart Plan for Paulsens"
- Mt Clement – Black Cat ASX announcement on 24 November 2022 "High-Grade Au-Cu-Sb-Ag-Pb Resource at Paulsens"
- Merlin, Electric Dingo – Black Cat ASX announcement on 25 May 2022 "Coyote & Paulsens High-Grade JORC Resources Confirmed"

## JORC 2012 Gold Reserve Table - Black Cat (100% Owned)

| Mining Centre                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Proven Reserve |                |                 | Probable Reserve |                |                 | Total Reserve |                |                 |

**Key movements during FY26**

Group Mineral Resources increased by approximately 4% in tonnes to 30.3Mt, while contained gold reduced by approximately 8% to 2.31Moz, reflecting mining depletion, updated geological interpretations and Resource estimation, partially offset by Resource growth at Trojan and other areas.

Group Ore Reserves increased by approximately 21% in tonnes to 5.3Mt, while contained gold reduced by approximately 18% to 272koz, reflecting mining depletion, updated operating assumptions and the addition of the maiden Ore Reserve at Imperial Open Pit.

The FY26 estimates incorporate the transition of Black Cat from developer to producer and, for the first time, depletion from active mining operations at Paulsens and Kal East.

A comparison of the updated Mineral Resource and Ore reserves to the 2025 Resources are outlined below.

## Comparison with June 2025 Mineral Resource

This announcement has been approved for release by the Board of Black Cat Syndicate Limited

## Competent Person's Statements

The information in this release that relates to the Estimation and Reporting of Mineral Resources for Queen Margaret, Melbourne United, Fingals Fortune, Majestic and Trojan, has been compiled by Mr Matthew Karl. Mr Karl is a full-time employee of, the Company. Mr Karl is a Member of the Australasian Institute of Mining and Metallurgy (AusIMM - 318243) and a member of the Australian Institute of Geoscientists (AIG - 3925), and has sufficient experience with the style of mineralisation, deposit type under consideration and to the activities undertaken to qualify as a Competent Person as defined in the 2012 Edition of the "Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (The JORC Code)". Mr Karl consents to the inclusion in this report of the contained technical information relating the Mineral Resource Estimation in the form and context in which it appears.

The information in this announcement that relates to geology, exploration results, and the estimation and reporting of gold Mineral Resources at the Paulsens Underground deposit is based on information compiled by Mr David Potter, BSc, a Competent Person and a current Member of the Australian Institute of Geoscientists (MAusIMM no. 112912). Mr Potter, Group Mine Geology Manager at Black Cat Syndicate Ltd, is a fulltime employee and shareholder of Black Cat Syndicate Ltd (BC8) with sufficient experience relevant to the style of mineralisation and deposit type under consideration and to the activities being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Potter is an option/rights holder of the Company Mr Potter consents to the inclusion in the report of matters based on his information in the form and context in which it appears.

The information in this announcement that relates to Resources at Coyote was compiled by Mr. Iain Levy, who is a Member of the AIG and an employee, shareholder and option/rights holder of the Company. Mr. Levy has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity being undertaken to qualify as a Competent Person as defined in the 2012 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr. Levy consents to the inclusion in the report of the matters based on the information in the form and context in which it appears.

The information in this report that relates to the Kal East Underground Ore Reserves is based on and fairly represents information compiled by Mr. Rory Reed. Mr Reed is a full-time employee of Black Cat Syndicate Pty Ltd. Mr Reed has confirmed that he has read and understood the requirements of the 2012 Edition of the Australian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Reed is a Competent Person as defined by the JORC Code 2012 Edition, having more than five years' experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity for which he is accepting responsibility. Mr Reed is a Member of the AusIMM and consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

The information in this report that relates to the Paulsens Underground Ore Reserves is based on and fairly represents information compiled by Mr. Juan Giraldo. Mr Giraldo is a full-time employee of Black Cat Syndicate Pty Ltd. Mr Giraldo has confirmed that he has read and understood the requirements of the 2012 Edition of the Australian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Giraldo is a Competent Person as defined by the JORC Code 2012 Edition, having more than five years' experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity for which he is accepting responsibility. Mr Giraldo is a Member of the AusIMM and consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

The information in this report that relates to the Open Pit Ore Reserves is based on and fairly represents information compiled by Mr. Alistair Thornton. Mr Thornton is a full-time employee of Black Cat Syndicate Pty Ltd. Mr Thornton has confirmed that he has read and understood the requirements of the 2012 Edition of the Australian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves. Mr Thornton is a Competent Person as defined by the JORC Code 2012 Edition, having more than five years' experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity for which he is accepting responsibility. Mr Thornton is a Member of the AusIMM and consents to the inclusion in the report of the matters based on his information in the form and context in which it appears.

For Mineral Resource and Ore Reserve estimates reproduced from previous ASX announcements and not updated in this release, the Company confirms that it is not aware of any new information or data that materially affects those estimates and that all material assumptions and technical parameters underpinning those estimates continue to apply and have not materially changed.

Where the Company refers to the exploration results, Mineral Resources, and Reserves in this report (referencing previous releases made to the ASX), it confirms that it is not aware of any new information or data that materially affects the information included in that announcement and all material assumptions and technical parameters underpinning the Mineral Resource and Reserve estimates with that announcement continue to apply and have not materially changed.

## JORC CODE (2012) AND ASX LISTING RULES

This announcement has been prepared in accordance with the Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves (The JORC Code – 2012 Edition) (“**JORC Code (2012)**”) and ASX Listing Rules. Investors are referred to several important statements in relation to this announcement and the March 2026 Resource and Reserve update contained herein including the Cautionary Statement; Forward Looking Statements; Sensitivity Analysis; and Competent Persons’ Statements.

### CAUTIONARY STATEMENT (IN ACCORDANCE WITH CLAUSE 38 OF JORC CODE (2012))

**Assumptions:** The Resource and Reserve update is based on the material assumptions outlined in this announcement. These include assumptions about the availability of funding. While Black Cat considers all the material assumptions to be based on reasonable grounds, there is no certainty that they will prove to be correct or that the range of outcomes indicated by the Resource and Reserve update will be achieved.

**Inferred Resources:** No Inferred Resource is considered in the Reserve update.

**Uncertainty:** Given the uncertainties involved, investors should not make any investment decision based solely on the results of the Resource and Reserve update.

**Economic Viability:** Black Cat considers the deposits subject to the Reserve update to be economically viable based on a gold price of A\$4,500/oz.

**JORC Code (2012) and ASX Listing Rules:** The Resource and Reserve update has been prepared in accordance with the JORC Code (2012) and ASX Listing Rules.

### 1 IMPERIAL OPEN PIT

In accordance with ASX Listing Rules 5.8 and 5.9, detailed supporting information is provided below for Mineral Resource and Ore Reserve estimates reported for the first time or where a material change has occurred. Estimates reproduced from previous announcements without material change are referenced to their original disclosures.

#### 1.1 Open Pit Modifying Factors

The open pit design process included the following steps:

- The Resource block model was modified with all Inferred Resource set to 0.00g/t Au, then reblocked to the selected standard mining unit dimension. Material above the cut-off grade was flagged as Ore.
- Pit optimisation shells were generated using diluted Resource models, contractor supplied rates, and overall wall angles derived from geotechnical parameters.
- Mine and infrastructure designs were developed to calculate requirements for clearing, stripping and stockpiling of vegetation and topsoil.
- Grade control drilling requirements were estimated.
- Blast hole drill metres and explosive quantities were calculated based on oxidation state and industry standard powder factors; and
- Load and haul production was scheduled based on the capabilities of 120t excavators, 90t rigid trucks mining 2.5m fitch heights, with consideration of haulage distance to mine ROM pads and waste dumps.

| Parameter                         | Oxidation    | Imperial |
|-----------------------------------|--------------|----------|
| <b>Cut-off Grade (g/t Au)</b>     | Oxide        | 0.4      |
|                                   | Transitional | 0.4      |
|                                   | Fresh        | 0.4      |
| <b>Metallurgical Recovery (%)</b> | Oxide        | 95       |
|                                   | Transitional | 95       |
|                                   | Fresh        | 90       |
| <b>Mining Dilution (m)</b>        | Oxide        | 1.25     |
|                                   | Transitional | 1.25     |
|                                   | Fresh        | 1.25     |
| <b>Mining Recovery (%)</b>        |              | 90       |

**Table 2:** Resource model modifying factors

| Parameter            | Oxidation            | Imperial |
|----------------------|----------------------|----------|
| <b>Face Height</b>   | Oxide                | 10m      |
|                      | Transitional         | 10m      |
|                      | Fresh                | 20m      |
| <b>Face Angle</b>    | Oxide                | 60°      |
|                      | Transitional         | 60°      |
|                      | Fresh                | 80°      |
| <b>Berm Width</b>    | Oxide                | 5m       |
|                      | Transitional         | 5m       |
|                      | Fresh                | 10m      |
| <b>Haul Rd Width</b> | Surface to -50m      | 21m      |
|                      | -50m to base of pit  | 12m      |
|                      | Passing Bay Interval | 20m      |

Table 3: Open Pit geotechnical design specifications

| Production Drilling Parameters |        |              |       |
|--------------------------------|--------|--------------|-------|
| Material Type                  | Oxide* | Transitional | Fresh |
| Hole Diameter (mm)             | 102    | 102          | 102   |
| Burden (m)                     | 4.0    | 3.5          | 2.8   |
| Spacing (m)                    | 4.6    | 4.0          | 3.2   |
| Sub-drill (m)                  | 0.5    | 0.5          | 0.6   |
| Wall Control Factor            | 1.00   | 1.05         | 1.08  |
| Powder Factor (kg/bcm)         | 0.3    | 0.4          | 0.7   |
| Ave Penetration Rate (m/OH)    | 35     | 30           | 22    |

Table 4: Open pit drill and blast parameters (\*50% blasting, 50% free dig)

## 1.2 Permitting and Approvals

Imperial is currently approved as an underground operation. Open pit approvals will be progressed as required.

## 2 Mineral Processing – Kalgoorlie East Operations

### 2.1 Processing Facility

A key change to the assumptions underpinning the Kal East Ore Reserves is the processing pathway. Previous Ore Reserve estimates assumed construction and operation of a new processing facility at Kal East. Following the acquisition of the Lakewood Processing Facility on 31 March 2025, the current Ore Reserves assume processing of Kal East ore through the Company-owned Lakewood Processing Facility.

The acquisition of Lakewood provides Black Cat with an established, permitted and operating processing facility approximately 6km southeast of Kalgoorlie and within approximately 40km of the Kal East mining centres. Lakewood has subsequently been utilised to process ore from Kal East, including ore from the Myhree open pit

The Lakewood Processing Facility, initially constructed in 1989, has an approved throughput capacity to 1.5 Mtpa. Lakewood is designed to process free-milling gold ore using conventional CIL technology. First, the ore is crushed and ground into a fine slurry. Coarse gold is recovered through gravity concentration, while the remaining gold is extracted using a cyanide leach process. Activated carbon adsorbs the dissolved gold, which is then recovered through a process of elution, electrowinning, and smelting for refinement into doré bars.

The leaching circuit consists of ten tanks: one large primary leach tank and nine smaller adsorption tanks. The pH, free cyanide concentration, and oxygen levels in the slurry are monitored, and the addition rates of lime, cyanide, and oxygen are adjusted to maintain optimal conditions. Activated carbon is added to the slurry to absorb the dissolved gold. Once the gold is adsorbed, the barren slurry is sent to a TSF.

## 2.1.1 Power

Lakewood utilises a 33kV power supply from Western Power. Off-take power infrastructure is maintained by Black Cat. A diesel generator provides emergency power to critical systems, including the leaching circuit, TSF disposal, water supply and essential facilities.

## 2.1.2 Water

Lakewood's water supply is sourced from two main sources: recycled water from TSF and groundwater from the borefields. The TSF water return averages 55-58% of the annual water usage. The two borefields include:

- **Fractured Rock Borefield:** Located on M26/242, this borefield consists of three production bores (WB01, WB02, and WB03). It has a 5C water licence that allows for the annual abstraction of 370,000 kilolitres.
- **Paleochannel Borefield:** Located on L26/234, this borefield consists of two production bores (WB-04 and WB-05). It has a 5C water licence that allows for the annual abstraction of 530,000 kilolitres with an application underway to increase the annual abstraction to 1,000,000 kilolitres.

## 2.2 Tailings Storage Facility

Lakewood operates two paddock-style TSFs designed to accommodate a plant throughput of up to 1.5Mtpa. The total approved storage volume is approximately 6 million cubic metres, providing a storage life of approximately 4 years through to 2030.

## KAL EAST GOLD OPERATION

### KAL EAST MINERAL RESOURCES

#### Geology and Geological Interpretation

##### Fingals

Mineralisation at Fingals Fortune is predominantly hosted in variably sheared basalts, with previous open pit sampling indicating that gold is generally hosted within quartz veining. Limited, lower-grade gold may potentially occur within the alteration zone.

Mineralisation has strong structural controls, with the reactivation of the bedding parallel thrusts during the sinistral oblique-slip shear event thought to be the mineralising event. As Fingals Fortune occurs close to the Mt Monger Anticline fold hinge, there are multiple orientations to mineralisation, generally controlled by intersections of favourable interflow units with the sub-vertical NNW sinistral shearing. Three main orientations of mineralisation have been observed:

- Moderately shallow westerly dipping veins following the bedding parallel thrust structures;
- South dipping veins following the tensional structures – these roll over in the north and appear to dip both east and north at the anticline; and
- Narrow subvertical veins following the sinistral oblique-slip shear zones. These are apparent in historical open pit channel sampling during grade control but cannot be confidently identified within Resource drilling. As such, they are being included where sufficient grade control is complete.

##### Majestic

Two distinct styles of mineralisation are observed within the Majestic area. One is associated with the dykes and the other with the later veins of varying composition and orientation.

Dyke associated mineralisation:

- NNW-NNE orientation, westerly dipping and varying width from cm to m scale.
- Elevated Gold generally associated with increase in pyrite, sericite and silica content.
- Gold expressed both as coarse inclusions in the groundmass and as micro gold inclusions within other minerals (sulphides)

Vein associated mineralisation:

- Thin, discrete and randomly orientated.
- Elevated Gold is related to veins proximal to or cross cutting mineralised dykes.
- Vein assemblage is variable, biotite-pyrite-albite rich veins and recrystallised quartz veins have the strongest correlation with Gold (Keric 2012).
- Later stage albite-silica-hematite alteration overprints mineralised veins.

### Drilling Techniques

Mineral Resources have primarily been defined by Diamond (DD) and Reverse Circulation (RC) drilling. Diamond drilling has been completed at NQ2 (47mm) and HQ3 (64mm) core sizes and oriented where possible to facilitate the acquisition of structural data. Drill hole collars were surveyed in MGA coordinates using RTK GPS. RC holes have been surveyed with multi shot at intervals ranging from 10m to 30m. DD holes have been surveyed with a down-hole survey method of magnetic gyroscope or magnetic camera, which are captured for most of the hole depth.

### Sampling and sub-sampling techniques

For RC drilling, a face-sampling hammer was used with samples collected at 1m intervals from mineralised zones with composite sampling of 4m or 5m in unmineralised rocks. Samples were collected through rig-mounted or free-standing riffle or cone splitters. Samples were reported to have been kept dry throughout the mineralised zones and visually determined recoveries were good.

Diamond drilling was completed using a HQ or NQ drilling bit for all diamond holes. Sampling intervals are selected by the geologist and are split with half core samples bagged and sent for assay

### Sample Analysis Method

For RC drilling, a face-sampling hammer was used with samples collected at 1m intervals from mineralised zones with composite sampling of 4m or 5m in unmineralised rocks. Samples were collected through rig-mounted or free-standing riffle or cone splitters. Samples were reported to have been kept dry throughout the mineralised zones and visually determined recoveries were good.

Diamond drilling was completed using a HQ or NQ drilling bit for all diamond holes. Sampling intervals are selected by the geologist and are split with half core samples bagged and sent for assay.

### Estimation methodology

New drilling and geological mapping have indicated thinner and less continuous higher grade mineralisation within broader discrete zones at both Fingals and Majestic. Mineralisation is now reflected as zones rather than discrete high grade veins.

**Figure 3:** Updated Fingals mineralisation interpretation (2021 MRE - Left; 2026 MRE - Right)

Gold grades have been estimated using ordinary kriging (OK) using 1m composited and top-cut drillhole data, comprising reverse circulation and diamond drillholes only. The estimation strategy has been defined based on data support and a review of the kriging neighbourhood analysis for major domains. The estimation uses a staged search strategy, with the first search distance generally the aligned to the modelled variogram (using between 8-16 sample), then expanding to two times (maintaining the same sample pairs) and finally a third pass designed to estimate the remaining un-estimated blocks. The parent block size reflects half the drill spacing and sub-celled to accurately reflect the volume of the modelled domains.

Density values have been assigned based on weathering surfaces and lithology.

The estimation has been verified through available production reconciliation and resources and grade control metrics where close spaced drill data becomes available.

### Cutoff Grades

The in-situ Mineral Resources have been reported to an appropriate cutoff defined by mining method to optimised pit shells or MSO shapes for open pit and underground resources respectively.

## Resource Classification

No Measured Mineral Resources has been assigned at Kalgoorlie East projects.

Indicated mineralisation was typically classified based on material that has previously been grade controlled to the 345 RL and drill spacing that are up to 25 x 25 metres below the grade control drilling for open pit resources, and drill spacing of 20 x 20 metres for underground resources. Indicated is generally estimated on the first or second search pass only.

Inferred mineral resources are based on limited data support. No development for geological mapping; typically drill spacing greater than 25m x 25m (down to 60m x 60m at resource extents).

Further considerations of resource classification include; Data type and quality (drilling type, drilling orientations, down hole surveys, sampling and assaying methods); Geological mapping and understanding; statistical performance including number of samples, slope regression and kriging efficiency

## Metallurgical Assumptions

No metallurgical assumptions have been built or applied to the Resource models

## PAULSENS GOLD OPERATION

### PAULSENS MINERAL RESOURCES

#### Geology and Geological Interpretation

The Paulsens Project Area is located within the Hamersley Basin, comprising Paleoproterozoic low-grade metasedimentary and metavolcanic rocks that flank the southern edge of the Archaean Pilbara craton.

Paulsens Underground is located on the northern limb of the Wyloo Dome. The geology is characterised by rocks comprising the Hardey Formation of the lower Fortescue Group sequence. The Hardey Formation has been informally subdivided into five members termed the Hornewell Sandstones, Melrose Argillite, Madang Clastics, Tin Hut Basalt and the Beaghy Sandstones. These members are defined as a predominately sedimentary succession of siliclastics, with minor mafic which has been intruded by doleritic to gabbroic dyke swarms and sills of varying ages.

Locally, the mine area is dominated by the Paulsens Mine Gabbro (40-60m in width) that has intruded the sediments prior to mineralising events. This Gabbro has been offset by normal faulting, causing a plunging 'tear' in the unit at ~30° towards the northwest. This tear has been filled with a massive and barren quartz vein that was host to the historically mined mineralisation. Late-stage diorite dykes crosscut the geology and mineralisation.

Mineralisation is generally concentrated on, or close to, the margins of the massive, quartz vein that fills the tear within the offset Mine Gabbro. Mineralisation is also found within the Mine Gabbro itself, forming narrower, high-nugget quartz/sulphide veins.

#### Gold Mineralisation

1. Gold mineralisation presents as three (possibly four) different events each associated with quartz +/- carbonate +/- sulphide veining. It is present:
2. As early 'stringer' veins/stockwork within gabbro clasts within the main massive quartz vein.
3. At the upper and lower margins of the main massive bucky quartz body which developed along a fault (normal?) associated with a distinct offset of the gabbro.
4. The upper zones are associated within multiphase breccias with significant amount of massive sulphide (Py+/-Cpy) occurring in and below flatter parts of the vein (fold hinges?).
5. The lower zones are distinctively planar laminated, often stylonitic recrystallised quartz occurring in steeper parts of the vein (the limbs?).
6. The 'quartz body' itself contains a complex sequence of multiple styles with multiple mineralised zones at a local scale splay and complex breccias extend out from and crosscut out the individual lodes, suggesting a yet unresolved complex sequence of events.
7. A later style of mineralisation is associated with narrow high grade nuggetty veins within the mine gabbro that can form as swarms. These are more traditional narrow vein style lodes with widths of typically 0.2 m to 3.0 m and appear to have partly remobilised mineralisation. The mineralisation orientation of the gabbro veins is predominantly east west and plunging at approximately 30° to the east. These narrower high-grade veins are also now being identified outside of the gabbro and can be seen to crosscut the earlier mineralisation.

### Drilling Techniques

Geological and assay drilling information for Paulsens Underground has been obtained by reverse circulation, diamond drilling and face/rise sampling. While other drilling types such as RAB and underground sludge holes have been completed at Paulsens, they are used only to guide geological and mineralisation wireframes.

### Sampling and sub-sampling techniques

#### RC Chip Sampling

RC drilling was carried out by a number of companies prior to the commencement of mining at the Paulsens deposit. The majority of the RC holes were drilled by Taipan Resources. Historical RC drilling is recorded as being carried out with a face sampling hammer at a diameter of between 4½ to 5½ inches. These RC holes were sampled as 1 m or 4 m composites.

#### Black Cat Diamond Core Sampling

Diamond drilling size was NQ2 and drilled from underground collars, mostly located within existing decline development. All core was drilled within fresh rock and selectively orientated. Core was logged through its entirety and selectively sampled. Samples were selected based on geological logging and ranged in size from 0.2m to ~ 1.0m. All samples were crushed, dried and pulverised to a nominal 90% passing 75 µm to produce a 40 g sub-sample for analysis by fire assay/AAS.

Core samples are collected from the entire core for grade control definition holes, whereas exploration holes were sampled following a similar procedure as outlined above, using half-core sampling.

#### New Drilling and Mapping

Since the last resource update, Black Cat has undertaken a further 34,979 m of underground diamond drilling within 296 holes plus 9434 m of extra face, wall and rise mapping and 113.6 m of sludge drilling. The model also includes 1890 m of RC drilling from 10 holes

### Sample Analysis Method

For RC drilling, a face-sampling hammer was used with samples collected at 1m intervals from mineralised zones with composite sampling of 4m or 5m in unmineralised rocks. Samples were collected through rig-mounted or free-standing riffle or cone splitters. Samples were reported to have been kept dry throughout the mineralised zones and visually determined recoveries were good.

Diamond drilling was completed using a HQ or NQ drilling bit for all diamond holes. Sampling intervals are selected by the geologist and are split with full core samples bagged and sent for assay.

### Estimation methodology

Gold grades have been estimated using ordinary kriging (OK) using 1m composited and top-cut drillhole data, comprising reverse circulation and diamond drillholes only. The estimation strategy has been defined based on data support and a review of the kriging neighbourhood analysis for major domains. The estimation uses a staged search strategy, with the first search distance generally aligned to the modelled variogram (using between 8-16 sample), then expanding to two times (maintaining the same sample pairs) and finally a third pass designed to estimate the remaining un-estimated blocks. The parent block size reflects half the drill spacing and sub-celled to accurately reflect the volume of the modelled domains.

Density values have been assigned based on weathering surfaces and lithology.

The estimation has been verified through available production reconciliation and resources and grade control metrics where close spaced drill data becomes available.

### Cutoff Grades

The in-situ Mineral Resources have been reported to an appropriate cutoff defined by mining method to optimised pit shells or MSO shapes for open pit and underground resources respectively.

### Resource Classification

- No Measured Mineral Resources has been assigned at the Paulsens Underground project. Indicated Resource classification was where the mineralisation has been sufficiently defined by a drill spacing of 20-25 m x 20-25 m or better and slope of regression >0.6. Blocks classified as Indicated were also generally estimated in the first or second interpolation pass.
- Inferred Mineral Resources were outlined where a low to moderate level of geological confidence in geometry, continuity and grade was demonstrated and were identified as areas where blocks were supported by drilling a drill spacing of around 50 m x 50 m and slope of regression was above 0.3.
- Unclassified was assigned to all mineralisation that did not fall into these categories and was not reported.

Further considerations of resource classification include; Data type and quality (drilling type, drilling orientations, down hole surveys, sampling and assaying methods); Geological mapping and understanding; statistical performance including number of samples, slope regression and kriging efficiency

## Metallurgical Assumptions

No metallurgical assumptions have been built or applied to the Resource models

## Audits and Reviews

Internal reviews of the Resource were completed as per Black Cat's usual processes. Black Cat also engaged Entech Mining Pty Ltd to carry out independent review of inputs to the MRE and processes and outcomes underpinning the MRE.

## COYOTE GOLD OPERATION

### COYOTE MINERAL RESOURCES

#### Geology and Geological Interpretation

Coyote is hosted within the Tanami Orogen which comprises a sequence of folded metasediments, mafic volcanics and intrusive rocks unconformably overlying Archaean basement. The known Archaean basement includes the informally named 'Billabong Complex' and the Browns Range Dome. The Tanami Orogen is a significant gold host with other major deposits located across the region including Callie 14Moz, The Granites 1.1Moz, and Groundrush 1.7Moz.

#### Lithology

The local geology of Coyote is situated within the Killi Killi formation. These are sand rich Proterozoic turbidites comprised of poorly sorted sandstones, siltstones and variable amounts of carbonaceous mudstones. The Killi Killi sequence extends well over 100m in thickness, however the individual beds range from 0.3m to 15m thick. Within the Coyote deposit, the 'Marker Siltstone' and 'Kavanagh Sandstone' are important marker units for mineralisation interpretation and boundaries.

The Coyote deposit is obscured by a widespread paleochannel and is deeply weathered. The oxide profile comprises weakly consolidated sand, sheetwash and alluvial lithologies and clay-dominated sequences. This is overlain by transported red aeolian sand. The deeply weathered profile sits directly over the top of the in-situ bedrock with limited saprock present. Oxidised saprolite is commonly present to depths of more than 100m.

#### Structure

The entire Killi Killi sequence has been tightly folded into an angular anticline. The Coyote deposit is located east-west on the Coyote Anticline, within a small parasitic fold within the greater anticline, and plunges shallowly west at ~15°. The anticline's limbs dip from 30-50° in the northern limb and 70-90° in the southern limb. The southern limb has a secondary fold axis known as the Buggy anticline, a drag fold associated with the Coyote Fault that offsets the stratigraphy. These limbs contain smaller faults and parasitic folds controlling mineralisation at mine scale. The Marker Siltstone and Kavanagh Sandstone have been the primary units used to delineate the sequence and orientation of the bedding and fold structures.

#### Mineralisation

Mineralisation is hosted in narrow high-grade quartz veins that are concentrated around the fold hinge areas. The mineralisation presents in the form of quartz veins, either parallel to bedding, or along faulting within the fold hinge, and is often concentrated in areas of local folding. In areas such as the high grade Kavanagh deposit, these veins can extend completely through the fold hinge zone and often host coarse, visible gold.

#### Drilling Techniques

Air core and RAB drilling were carried out by Acacia and subsequently AngloGold-Ashanti between 1992-2002. Extensive RC and diamond drilling was carried out by Tanami Gold NL following their acquisition of Coyote. Black Cat has completed RC and diamond drilling programs since acquiring the project in mid-2022. Drilling has focused on the Axial Core Zone within Central Coyote, to both upgrade and extend the existing Resources

#### Sampling and Sub Sampling Techniques

RC drill chips are collected directly from a cone splitter on the drill rig and automatically fed into pre-numbered calico bags. All sample intervals were sampled at 1m, with a target sample weight of 2-3kg. The splitter and cyclone are cleaned and levelled at the beginning of every hole and cleaned at regular intervals during drilling. Observations of sample size and quality are made while logging. The holes are logged for lithology and alteration, and chips are collected and photographed in chip trays for archiving.

Diamond drilling from surface is generally mud roller through the oxide as a pre-collar, HQ down to about 150-200m and then NQ2. All core was oriented within fresh rock, is logged and sampled throughout its length. Samples were selected based off

geological logging and ranged in size from 0.3-1.1m. Core is cut down the orientation line where available and then the righthand side sampled in all cases for constancy. All samples are crushed, dried and pulverised to a nominal 90% passing 75µm to produce a 40g sub sample for analysis by fire assay/AAS.

A combination of certified reference materials, coarse blanks and duplicates are included in the sampling submitted to the laboratory. Every 100 samples includes two blanks, two duplicates and five certified reference standards. To date, an acceptable level of precision and accuracy has been observed.

For historical drilling, RC samples were collected from a rig mounted riffle splitter in 1m intervals. The intervals were split into ~3kg samples using a rig mounted 12.5% to 87.5% three tier riffle splitter, directly from the rig cyclone. These samples were collected directly into calico sample bags. The remaining 87.5% sample split was collected in plastic sample retention bags. The cyclone and splitter were cleaned at the end of every 3m rod using a compressed air gun. Shallow holes did not encounter wet sampling. Chips were logged for lithology, moisture content, recovery, mineralisation and weathering. Chip trays were photographed and archived.

### Criteria Used for Resource Estimation

The Resource for Coyote Central is classified as Indicated and Inferred. The drill holes used consisted of RC (426) and diamond (670) for a total of 193,480m of drilling.

### Estimation Methodology

Wireframes of mineralisation and weathering, guided by geological understanding, were constructed in Leapfrog, and validated in all orientations.

Drill hole data has been composited downhole to 1m within respective mineralisation domains using hard boundaries with a variable sample length method. This keeps the sample intervals as close to a set length (1m) as possible, in this case with no residuals.

Estimation domains with high COV (>2) or extreme outliers were investigated with extreme grade limitation techniques to manage their impact on the Ordinary Kriging estimate. Two techniques were used during estimation depending on the spatial distribution of extreme grades:

- Top cuts (globally cap a grade at a certain value for all of the domain) – used where the outliers are spatially isolated with no other high-grades surrounding it; and
- Outlier restriction (cap a grade based on the distance that sample is from the block being estimated) – used where there are a number of spatially continuous samples in multiple drill holes. This results in reflecting the local high-grade zone without smearing into lower grade areas.

Estimation of the mineralised domains is completed using Ordinary Kriging into the Parent Blocks with 5 x 5 x 5 discretisation points. This is considered the most appropriate method with respect to the observed continuity of mineralisation, spatial analysis and dimensions of the domains defined by drilling. A total of 130 mineralised domains were modelled.

Bulk density values were applied according to regolith type and are based off historical density measurements of diamond core using water immersion method.

Validation steps of the Resource included the comparison of input assay data against the modelled grades. This was completed by checking the global averages of each domain, visually checking the spatial distributions of grade, and assessing swath plots in the three major orientations

### Cut-Off Grades

Resources are reported at a 0.7g/t Au lower cut-off grade for open pit and 3.5g/t Au lower cut-off grade for underground. Cut-off grades have been calculated from first principles, using up to date and escalated mining costs and parameters.

There is no reference to QAQC reported in annual reports for this period.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                                         | Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1m samples from which 3kg was pulverised to produce a 30g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems.<br>Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information. | Mistral Mines completed the bulk of exploration drilling for the Fingals Resource in 1990 using a Schramm RC drill rig. All samples were collected from the cyclone in bags for each metre drilled. Three metre composites samples were obtained by riffle splitting the 1m samples and combining into a 2kg composite sample. 1m re-split samples were taken where the 3m composite sample returned a grade above 0.2g/t Au.<br>Analysis was completed at Classic Laboratories and Analabs in Kalgoorlie by fully pulverising the sample before splitting. A 50g charge was analysed by fire assay.<br>Mt Monger Gold Project JV completed grade control drilling in 1991 using a 3 7/8 inch reverse circulation roller bit with a hammer and cross over sub for hard vein materials. Samples were bagged in 1m intervals and a 4m composite was collected by either riffle or spear sampling. Where assay values of greater than 0.2g/t Au were recorded, the intervals were re-split using a riffle splitter and re-assayed.<br>All samples were crushed, dried and pulverised and analysed using aqua regia digest with AAS finish due to check samples indicating fire assay produced similar results.<br>Black Cat's reverse circulation drilling was sampled into 1m intervals via a cone splitter on the rig producing a representative sample of approximately 3kg. Samples were selected to weigh less than 3kg to ensure total sample inclusion at the pulverisation stage. All samples were crushed, dried and pulverised to a nominal 90% passing 75µm to produce a 40g or 50g sub sample for analysis by FA/AAS. |
| Drilling techniques                     | Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).                                                                                                                                                                                                                                                                                 | The size of historical RC and diamond drilling by Mistral Mines is unknown.<br>Mt Monger Gold Project JV completed grade control drilling in 1991 using a 3 7/8 inch reverse circulation roller bit with a hammer and cross over sub for hard vein materials.<br>Black Cat's RC drilling was completed using a face sampling percussion hammer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Drill sample recovery                   | Method of recording and assessing core and chip sample recoveries and results assessed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Mt Monger Gold Project JV annual reports state that RC drilling was dry with good recovery and no issues observed.<br>Black Cat's RC drilling had recovery and sample dampness recorded as routine. There were no issues.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                                         | Measures taken to maximise sample recovery and ensure representative nature of the samples.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Sample representativity was checked using duplicates with acceptable results from Black Cat. Repeats of assays for Mistral Mines did not indicate any issues.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                                         | Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.                                                                                                                                                                                                                                                                                                                                                                                                        | There is no known relationship between sample recovery and grade.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Logging                                 | Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.<br>Whether logging is qualitative or quantitative in nature.                                                                                                                                                                                                                                                                                                          | Black Cat logging of reverse circulation chips record lithology, mineralogy, texture, mineralisation, weathering, colour, alteration, veining and structure.<br>Chips from all Black Cat's holes are stored and photographed for future reference. These chip/core trays are archived in Kalgoorlie. No historic core or chips are available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Annual Mineral Resource and Ore Reserve Statement

| Section 1: Sampling Techniques and Data        |                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Criteria                                       | JORC Code Explanation                                                                                                                                                                                                            | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Sub-sampling techniques and sample preparation | Core (or costean, channel, etc) photography.                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|                                                | The total length and percentage of the relevant intersections logged                                                                                                                                                             | All recent drilling has been logged in full.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                                                | If core, whether cut or sawn and whether quarter, half or all core taken.                                                                                                                                                        | The historical sampling method for diamond core is not discussed in the annual reports. Diamond core represents a very small percentage of the overall samples used in the Mineral Resource. It is not considered to have a material impact on the global estimate presented.                                                                                                                                                                                                                                                                                                |
|                                                | If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.                                                                                                                                    | All samples were bagged from the rig. Mistral Mines and Mt Monger Gold Project JV used a riffle splitter to take the 1m samples. Composites were created through both riffle splitters and spear sampling.<br>All Black Cat's RC sampling to date have been cone split to 1m increments on the rig. Most of the sampling has been dry. Where wet samples have been encountered, the hole is conditioned and splitter cleaned to prevent downhole contamination.<br>The sampling was generally dry as per Mt Monger Gold Project JV's annual reports and Black Cat's logging. |
|                                                | For all sample types, the nature, quality and appropriateness of the sample preparation technique.                                                                                                                               | Black Cat's sample preparation adheres to industry best practice. It is conducted by a commercial laboratory and involves oven drying, coarse crushing then total grinding to a size of 90% passing 75µm. Historic preparation of samples is unknown but assumed as industry standard.                                                                                                                                                                                                                                                                                       |
|                                                | Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.                                                                                                                            | All subsampling activities are carried out by commercial laboratory and are considered satisfactory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                                                | Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second half sampling.                                                         | Mistral Mines and Mt Monger Gold Project JV had repeats completed with no issues identified in the review of the data. Black Cat's reverse circulation field duplicate samples are carried out at a rate of 1:50 and are sampled directly from the on-board splitter on the rig. These are submitted for the same assay process as the original samples and the laboratory are unaware of such submissions.                                                                                                                                                                  |
| Quality of assay data and laboratory tests     | Whether sample sizes are appropriate to the grain size of the material being sampled.                                                                                                                                            | Black Cat sample sizes of 3kg are considered appropriate given the grain size (90% passing 75µm) of the material sampled.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                                                | The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.                                                                                 | All samples were analysed by an external laboratory. Mistral Mines used a 50g fire assay, Mt Monger Gold Project JV used aqua regia digest with AAS finish due to check samples indicating fire assay produced similar results. Black Cat samples are analysed by an external laboratory using a 40g fire assay with AAS finish.<br>These methods are considered suitable for determining gold concentrations in rock and are a total digest method.                                                                                                                         |
|                                                | For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. | No geophysical tools were used in this Mineral Resource.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Verification of sampling and assaying          | Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.                 | Historic drilling included duplicate sampling, and a review of the results did not indicate issues.<br>Black Cat's drilling adheres to strict QAQC protocols involving weighing of samples, collection of field duplicates and insertion of certified reference material (blanks and standards). QAQC data are checked against reference limits in the SQL database on import. The laboratory performs a number of internal processes including repeats, standards and blanks. Analysis of this data displayed acceptable precision and accuracy.                            |
|                                                | The verification of significant intersections by either independent or alternative company personnel.                                                                                                                            | Significant intercepts are verified by database, geological and corporate staff.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                                                | The use of twinned holes.                                                                                                                                                                                                        | Diamond twinning has not been completed. Close spaced drilling through the mined portion at grade control spacing provides insight into the continuity of mineralisation at short distance.                                                                                                                                                                                                                                                                                                                                                                                  |
|                                                | Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.                                                                                                       | Data has been reviewed from the digital file to the hard copies of annual reports with limited errors observed. Black Cat's Logging is completed in the field on a table before being uploaded into an SQL database. Assay files are uploaded directly from the lab into the database. The database is managed by a third party.                                                                                                                                                                                                                                             |
| Location of data points                        | Discuss any adjustment to assay data.                                                                                                                                                                                            | No adjustments have been made to the assay data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                                                | Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.                                                      | Survey control for Mistral Mines and Mt Monger Gold Project JV drilling is not discussed in the annual reports and represents a risk to the Mineral Resource which is reflected in the classification.<br>Black Cat's drilling is marked out using a handheld GPS prior to drilling. Once complete, the hole collars are picked up by an external contractor using RTK GPS. Downhole surveys are conducted by the drilling contractor at the end of each hole using a down hole north seeking gyro.                                                                          |

## Annual Mineral Resource and Ore Reserve Statement

| Section 1: Sampling Techniques and Data                 |                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                               |
|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criteria                                                | JORC Code Explanation                                                                                                                                                                                                        | Commentary                                                                                                                                                                                                                                                                                                                                    |
|                                                         | Specification of the grid system used.                                                                                                                                                                                       | Mistral Mines and Mt Monger Gold Project JV operated on local grid for the Mt Monger area (SOL) that has been converted to MGA 94 Zone 51 for estimation. All reported references are in MGA 94 Zone 51. Black Cat uses the grid system GDA 1994 MGA Zone 51.                                                                                 |
|                                                         | Quality and adequacy of topographic control.                                                                                                                                                                                 | The topographic surface was compiled using the collar surveys and is considered sufficiently accurate due to the high density of drill hole collars.                                                                                                                                                                                          |
| Data spacing and distribution                           | Data spacing for reporting of Exploration Results.                                                                                                                                                                           | The nominal drill hole spacing is 20m x 15m at Baguss and 25m x 10m at Futi Baguss. This increases to 25m x 25m or 50 x 50m on the extents. Infill and grade control drilling exists in mined out areas.                                                                                                                                      |
|                                                         | Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. | It is sufficient.                                                                                                                                                                                                                                                                                                                             |
| Orientation of data in relation to geological structure | Whether sample compositing has been applied.                                                                                                                                                                                 | Drill hole data has been composited downhole to 1m prior to the geostatistical analysis, continuity modelling and grade estimation process. The compositing has been run within the respective mineralisation domains using these as hard boundaries.                                                                                         |
|                                                         | Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.                                                                   | Exploration drilling has generally been drilled towards the west at -60 dip to intersect the mineralised zones. Holes drilled parallel to mineralisation were excluded. Infill and grade control holes (mostly mined out) were drilled vertical. These orientations are acceptable given the moderately dipping nature of the mineralisation. |
|                                                         | If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.                   | All drilling from surface has been drilled as close to perpendicular to the predicted orientation of stratigraphy as possible. This has reduced the risk of introducing a sampling bias as far as possible. No orientation-based sampling bias has been identified in the data at this point.                                                 |
| Sample security                                         | The measures taken to ensure sample security.                                                                                                                                                                                | The sample security of the historic drilling in unknown but is expected to have been acceptable. Black Cat's samples prepared on site by Black Cat geological staff. Samples are selected, collected into tied calico bags and delivered to the laboratory by staff or contractors directly and there are no concerns with sample security.   |
| Audits or reviews                                       | The results of any audits or reviews of sampling techniques and data.                                                                                                                                                        | A review of all available information on sampling and procedures used from annual reports has been completed by Black Cat's technical team. Black Cat's procedures are regularly reviewed by technical staff.                                                                                                                                 |

| Mineral tenement and land tenure status     | Type, reference name/number, location and ownership including agreements or material issues with third parties such as Joint Ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. | The Mineral Resources are located on M26/409, M26/248, M26/197. Mining Lease M 26/409 is held until 2034 and is renewable for a further 21 years on a continuing basis. Mining Lease M 26/248 is held until 2030 and is renewable for a further 21 years on a continuing basis. Mining Lease M 26/197 is held until 2030 and is renewable for a further 21 years on a continuing basis. All production is subject to a Western Australian state government Net Smelter Return ("NSR") royalty of 2.5%. There are no registered Aboriginal Heritage sites or pastoral compensation agreements over the tenements.                                                                                                                                                                                   |
|                                             | The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.                                                                                                                                     | No known impediment to obtaining a licence to operate exists and the tenements are in good standing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Exploration done by other parties           | Acknowledgment and appraisal of exploration by other parties.                                                                                                                                                                                                                | Fingals East (Baguss and Futi Baguss), along with Fingals Fortune, were first identified by Geopeko in joint venture with Mistral Mines in 1983-1984 through a systematic soil geochemical sampling program. This was followed up with costeans, RAB and RC drilling. Geopeko did not perceive the discoveries to be of sufficient size to be of interest to them and so withdrew from the joint venture in 1986. Mistral Mines continued to explore the area, and defined Fingals Fortune, producing a feasibility study in the 1990. Following Mistral Mines falling into receivership, the project was acquired by Ramsgate Resources, who formed the Mt Monger Gold Project JV with General Gold in 1991. Mining commenced on the Fingals Fortune and Futi Baguss deposits in January 1992 and |

Mining continued until 1993, and minor exploration around the area continuing until divestment.</p> <p>Since mining was completed, exploration of the Fingals Fortune and Fingals East deposits has been sporadic with various companies such as Solomon Australia, AurionGold Exploration, Integra Mining and Silver Lake drilling small programmes to test the potential of the deposits and other targets in the area.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

The geological sequence is comprised of mafic units of Hi-Mg basalts to pyroxenite gabbroic composition that occupy the core of the anticline, with bedding parallel intrusive dolerite sills and cross cutting quartz-feldspar porphyries. Mineralisation at Fingals East is hosted in a coarse grained dolerite unit within pillow basalts, with units dipping moderately to the east.</p> <p>Mineralisation is centred on a strike extensive 345°/45°E trending structure characterised by shearing/silicification and quartz vein development. Increases in gold mineralisation are associated with increases in vein development quartz/shearing and carbonate/mica and chlorite alteration.</p> <p>Mineralisation at Baguss is mostly contained within a consolidated shear zone oriented 350°/40°E and is offset by three late-stage ENE trending faults. At Futi Baguss, shearing on lithological contacts and within the dolerite produced a complex stockwork of quartz filled shears and flatter linking quartz shears. Mineralisation at Futi Baguss consists of a stacked series of shear zones which present as an intense zone of alteration and veining. The mineralised structures are oriented 360°/50°E in the upper parts of the deposit, shallowing to 30°E before steepening to -50°E again at depth. There is a shallow southerly plunge to the mineralisation.</p> <p>A deep weathering profile exists across the deposits down to 60m in places and displays supergene enrichment above 30 to 40m.</p> |
| <b>Drill hole information</b>                                           | <p>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</p> <ul style="list-style-type: none"> <li>– easting and northing of the drill hole collar;</li> <li>– elevation or Reduced Level ("RL") (elevation above sea level in metres) of the drill hole collar;</li> <li>– dip and azimuth of the hole;</li> <li>– down hole length and interception depth;</li> <li>– hole length; and</li> <li>– if the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li> </ul> | <p>All the drill hole data was used directly or indirectly for the preparation of the resource estimates described in the resource report. Exclusion of the drill information will not detract from the understanding of the report.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Data aggregation methods</b>                                         | In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | No exploration results reported within this announcement                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                                                                         | Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | No exploration results reported within this announcement                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| Criteria                                    | JORC Code Explanation                                                                                                                                                                                                                                                                                                                                                                 | Commentary                                                                                                                                                                                                                           |
|                                             | If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').                                                                                                                                                                                                                     |                                                                                                                                                                                                                                      |
| <b>Diagrams</b>                             | Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.                                                                                                                    | Appropriate diagrams were released at time of Resource announcement. Refer to the relevant Resource Announcement listed in Notes on Resources under Gold Resource Table of this announcement.                                        |
| <b>Balanced reporting</b>                   | Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.                                                                                                                                                             | No exploration results reported within this announcement                                                                                                                                                                             |
| <b>Other substantive exploration data</b>   | Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. | Geophysical surveys including aeromagnetic surveys have been carried out by previous owners to highlight and interpret prospective structures in the project area. No geophysics was used in the production of the Mineral Resource. |
| <b>Further work</b>                         | The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).<br>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.                                           | Black Cat plans to conduct continued exploration in the area to confirm the current interpretation and target extensions to the currently modelled mineralisation.                                                                   |

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in Section 1, and where relevant in Section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Geological interpretation</b>                                                                                                                      | Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.<br>Nature of the data used and of any assumptions made.<br>The effect, if any, of alternative interpretations on Mineral Resource estimation.<br>The use of geology in guiding and controlling Mineral Resource estimation.<br>The factors affecting continuity both of grade and geology. | The resource categories assigned to the model directly reflect the confidence of the geological interpretation that was constructed using local, structural, mineral, and alteration geology obtained from geophysics, logging, drilling results and pit mapping.<br><br>The geological interpretation has considered all available geological information. RC and Diamond drilling was used during interpretation with the exclusion of RAB and AC due to the lack of confidence in the technique for modelling and estimation.<br><br>Mineralisation at Baguss is predominantly hosted in a moderately east dipping shear zone that has been mapped in open pit exposures. Alternative interpretations are considered unlikely. Mineralisation at Futi Baguss consists of a stacked series of shear zones oriented shallow to moderately to the east. It is possible that dips may vary marginally from those modelled and any variation is not expected to have a material impact on the Mineral Resource.<br><br>Wireframes of the mineralisation were constructed using cross sectional interpretations based on a 0.5g/t Au cut-off grade with no minimum downhole length. Some holes with <0.5g/t Au were included to ensure consistent geological continuity. |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in Section 1, and where relevant in Section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

It is open along strike to the north, at depth in the north and down plunge to the south.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Estimation and modelling techniques</b>                                                                                                            | <p>The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</p> <p>The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</p> <p>The assumptions made regarding recovery of by-products.</p> <p>Estimation of deleterious elements or other non-grade variables of economic significance (e.g. sulphur for acid mine drainage characterisation).</p> <p>In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.</p> <p>Any assumptions behind modelling of selective mining units.</p> <p>Any assumptions about correlation between variables.</p> <p>Description of how the geological interpretation was used to control the resource estimates.</p> <p>Discussion of basis for using or not using grade cutting or capping.</p> <p>The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.</p> | <p>Gold grade was estimated using Leapfrog EDGE and was completed using ordinary kriging. It was considered that a more robust geological model with smoother and more continuous mineralised lodes will reduce the effects of higher CV. Estimation was carried out on the parent cell with 5x5x5 discretisation points.</p> <p>Variograms were generated for the main lode in each deposit, with variogram parameters assigned to similar domains.</p> <p>Search ellipse dimensions and orientation reflect the parameters derived from the variography and geological analysis.</p> <p>Only Au grade was estimated. No other elements were estimated.</p> <p>No deleterious elements were estimated or assumed.</p> <p>Block sizes were selected based on drill spacing and the thickness of the mineralised veins at 5m (east) by 10m (north) by 5m (z). Sub blocking down to 0.5/2/0.5 to honour estimation domain volumes was utilised.</p> <p>At Baguss, average drill spacing ranges from 12m x 8m in the mined portion down to 20m x 25m or 50 x 50m on the extents. At Futi Baguss, average drill spacing ranges from 6m x 8m in the mined portion down to 25m x 25m or 50 x 50m on the extents.</p> <p>No selective mining units were assumed in the resource estimate.</p> <p>Blocks were generated within the mineralised volumes that defined each mineralised zone. Blocks within these zones were estimated using data that was contained with the same zone. Hard boundaries were used for all domains.</p> <p>Top cuts were applied to the data to control the effects of extreme high-grade Au values that were considered not representative. The effect of the top cuts was reviewed with respect to the resulting Population distribution and fragmentation, mean and CV values.</p> <p>The model was validated by comparing statistics of the estimated blocks against the composited sample data; visual examination of the block grades versus assay data in section; swathe plots; and reconciliation against previous production and estimates.</p> |
| <b>Moisture</b>                                                                                                                                       | Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | All tonnages are reported on a 'dry' basis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Mining factors or assumptions</b>                                                                                                                  | Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <p>No minimum width is applied to the Resource. Minimum widths are assessed and applied using Whittle or Mining Shape Optimiser software during the Reserve process.</p> <p>It is assumed that planned dilution is factored into the process at the stage of Reserve and stope design planning.</p> <p>The open pit depth is applied to all material above the base of the \$AUD2,500 pit shell optimised with current industry rates.</p> <p>There is currently approximately 300,000m<sup>3</sup> of rock backfill and tailings within the Baguss pit and 600,000m<sup>3</sup> within the Futi Baguss pit that will need to be considered for any cut back to the current open pit.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Metallurgical factors or assumptions</b>                                                                                                           | The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>Assumed the material will be trucked and processed at Black Cat's own mill. Recovery factors are assigned based on lab test work, and on-going experience.</p> <p>No metallurgical assumptions have been built or applied to the Resource model.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in Section 1, and where relevant in Section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Criteria                                                                                                                                              | JORC Code Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Environmental factors or assumptions</b>                                                                                                           | Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.                                                                                                                                                                                                                                                 | A conventional storage facility is used for the process plant tailings.<br><br>Waste rock is to be stored in a traditional waste rock landform 'waste dump'. There is no evidence from previous mining to indicate the presence of deleterious elements within the Fingals East deposits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Bulk density</b>                                                                                                                                   | Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.<br><br>The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.<br><br>Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.                                                                                                                                                                                                                                                                                                                                                         | Bulk density is assigned based on regolith. Values of 1.80, 2.20 and 2.70 t/m <sup>3</sup> are used for oxide, transitional and fresh waste rock respectively.<br><br>Bulk density values were taken from the adjacent Fingals Fortune deposit which were based on historic test work and correlate well with results from other areas in the region with similar geology. Further work on density will be completed as the project progresses.<br><br>Density values are allocated uniformly to each regolith type.                                                                                                                                                                                                                                                                               |
| <b>Classification</b>                                                                                                                                 | The basis for the classification of the Mineral Resources into varying confidence categories.<br><br>Whether appropriate account has been taken of all relevant factors (i.e. relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).<br><br>Whether the result appropriately reflects the Competent Person's view of the deposit.                                                                                                                                                                                                                                                                                                                                                                                                                                                               | There is no Measured Mineral Resources at Fingals East.<br><br>Indicated Mineral Resources were defined where drill spacing is typically 25m x 25m.<br><br>Inferred mineral resources are based on limited data support. No development for geological mapping; typically drill spacing greater than 25m x 25m (down to 100m x 50m at resource extents).<br><br>Further considerations of resource classification include; Data type and quality (drilling type, drilling orientations, down hole surveys, sampling and assaying methods); Geological mapping and understanding; statistical performance including number of samples, slope regression and kriging efficiency.<br><br>The classification of the Mineral Resource estimate appropriately reflects the view of the Competent Person. |
| <b>Audits or reviews</b>                                                                                                                              | The results of any audits or reviews of Mineral Resource estimates                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | The geological interpretation, estimation parameters and validation of the Resource model were peer reviewed by Black Cat staff prior to accepting the responsibility for the Mineral Resource.<br><br>No external reviews of the Resource estimate had been carried out at the time of writing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Discussion of relative accuracy/ confidence</b>                                                                                                    | Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.<br><br>The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available. | The relative accuracy of the Mineral Resource estimate is reflected in the reporting of the Mineral Resource as per the guidelines of the 2012 JORC Code. The estimated uncertainty for ± 10% Measured Mineral Resources; ± 20 for Indicated Mineral Resources and ± 30% for Inferred Mineral Resources.<br><br>The statement relates to the global estimates of tonnes and grade above an RL selected from the base of an optimisation pit shell at a 0.7g/t Au cut-off and 2.0g/t Au below the pit.<br><br>The Mineral Resource was compared to historical production figures in mined out areas, with similar results achieved.                                                                                                                                                                 |

## Annual Mineral Resource and Ore Reserve Statement

| Section 4: Estimation and Reporting of Ore Reserves             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>The level of study is to Pre-Feasibility Study accuracy.</p> <p>The Pre-Feasibility Study has determined the mine plan is technically achievable and economically viable at the Reserve gold price of \$4,500 per ounce of gold.</p> <p>Modifying factors have been applied to Indicated Mineral Resource to determine Open Pit Reserves.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Cut-off parameters</b>                                       | <p>The basis of the cut-off grade(s) or quality parameters applied.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>Breakeven cut-off grades were calculated using planned mining costs. The breakeven cut-off included mining costs, surface haulage and processing costs.</p> <p>A Reserve cut-off grade of 0.4g/t has been used for open pit estimations.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Mining factors or assumptions</b>                            | <p>The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).</p> <p>The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.</p> <p>The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc.), grade control and pre-production drilling.</p> <p>The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).</p> <p>The mining dilution factors used.</p> <p>The mining recovery factors used. Any minimum mining widths used.</p> <p>The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.</p> | <p>Open pit optimisations were conducted using Datamine's Maxipit software. The optimal pit shell was selected based on NPV (with a zero % discount rate) and total volume. The optimal shell was used as the basis of a detailed pit design that would suit the selected mining equipment and proposed site layout.</p> <p>Open pit mining assumed a top down drill and blast and load and haul method on 5m benches, mined over two flitches. Drill and blast requirements assumed 50% blasting in oxide rock and 100% blasting in transitional and fresh rock. Associated design issues such as pre-strip, access, etc were considered in designing the mine.</p> <p>Geotechnical assessments of the rock mass were conducted for the Fingals East Open Pits. Pit design parameters for Fingals East were recommended by an external consultant.</p> <p>Required grade control requirements were estimated with contractor costs applied.</p> <p>The Fingals East May 2021 Mineral Resource Model was used for the open pit assessment.</p> <p>Mining dilution was applied to the Resource Model using Datamine's Mineable Shape Optimiser (MSO). The main assumptions used to determine the minable open pit shapes include; a minimum ore width of 1.25m wide, 0.625m dilution on footwall, 0.625m dilution on the hangingwall, stope length of 5m and stope height of 5m.</p> <p>An open pit mining recovery factor of 95% was applied to account for unplanned ore loss. Minimum ore mining width equals 2.5m (1.25m ore, 1.25m dilution).</p> <p>No Inferred Mineral Resource is considered in the mining study. Inferred Mineral Resource was assigned a grade of 0.01g/t before pit open pit optimisations or mining dilution was considered.</p> |

## Annual Mineral Resource and Ore Reserve Statement

| Section 4: Estimation and Reporting of Ore Reserves |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Criteria                                            | JORC Code explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                                                     | The infrastructure requirements of the selected mining methods.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | A site layout was designed as part of the mining study. The site layout considers the location, size and design criteria for waste dumps based on pre-existing landforms from historic mining. The site layout also considers abandonment bund location, office requirements, ore storage facilities, roads, surface water, workshops, etc.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Metallurgical factors or assumptions</b>         | <p>The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.</p> <p>Whether the metallurgical process is well-tested technology or novel in nature.</p> <p>The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.</p> <p>Any assumptions or allowances made for deleterious elements.</p> <p>The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the ore body as a whole.</p> <p>For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?</p> | <p>The metallurgical process proposed is two stage crushing and milling to 106µm with gravity recovery and carbon in leach extraction at Black Cat's Lakewood Gold Processing Facility.</p> <p>The metallurgical process is well tested and commonly used in similar operations worldwide.</p> <p>The Ore Reserve estimation was based on recoveries established during test programs carried out at the Fingals East deposit during 2021 - 2022. The Ore Reserve estimation has been based on the recoveries and processes outlined above which are well tested and established as being appropriate for similar metallurgical specifications.</p> <p>No deleterious elements were identified during metallurgical test work or historic processing.</p> <p>No bulk sample of pilot scale test work has been conducted. However, the ore has been historically processed by an analogous processing facility.</p>                          |
| <b>Environmental</b>                                | The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterization and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Various Environmental Studies have been completed by Black Cat Syndicate using various independent specialist consultants. It is considered that all approvals will be in place within the time period before project commencement. Similar approvals have been granted for operations in the area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Infrastructure</b>                               | The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided, or accessed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | The infrastructure and equipment required for the operation already exist on site.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Costs</b>                                        | <p>The derivation of, or assumptions made, regarding projected capital costs in the study.</p> <p>The methodology used to estimate operating costs.</p> <p>Allowances made for the content of deleterious elements.</p> <p>The derivation of assumptions made of metal or commodity price(s), for the principal minerals and co-products</p> <p>The source of exchange rates used in the study Derivation of transportation charges.</p> <p>The basis for forecasting or source of treatment and refining charges, penalties for failure to meet specification, etc.</p> <p>The allowances made for royalties payable, both Government and private.</p>                                                                                                                                                           | <p>Capital costs have been determined to Pre-Feasibility Study accuracy by receiving quotations for the work that is to be carried out.</p> <p>Operating mining costs have been determined to Pre-Feasibility Study accuracy by receiving quotations for the work that is to be carried out.</p> <p>Fingals East ore has been historically processed without mention of deleterious elements and has undergone test programs carried out during 2021 - 2022 with no deleterious elements identified.</p> <p>Treatment charges were based on current cost of treatment at the Company owned processing facility.</p> <p>All costs have been calculated in Australian Dollars.</p> <p>Ore treatment is assumed to be via a Company owned processing facility therefore no penalties apply.</p> <p>Allowances are made for state royalties of 2.5%. Refining and gold transportation costs are considered to be covered by silver credits.</p> |

## Annual Mineral Resource and Ore Reserve Statement

| Section 4: Estimation and Reporting of Ore Reserves |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                        |

| Criteria                                            | JORC Code explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                                                     | <p>stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.</p> <p>The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.</p> <p>Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.</p> <p>It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.</p> | <p>Metallurgical recoveries have been based on metallurgical test work from the Fingals East deposit using site water at the nominated grind size, with recoveries verified by historic mining.</p> <p>Costs have been estimated by the Competent Person from budget quotations, factored estimates, or cost data from similar operations/ projects</p> <p>A degree of uncertainty is associated with geological estimates and the Ore Reserve classification reflects the level of confidence in the Mineral Resource</p> <p>There is a degree of uncertainty regarding estimates of modifying mining factors, geotechnical and processing parameters and the Ore Reserve classification reflects the level of confidence of the study.</p> <p>The Competent Person is satisfied that the current gold price is sufficient that the Ore Reserve estimate would remain economically viable with any negative impacts applied to these factors or parameters</p> <p>There is a degree of uncertainty in the commodity price used however the Competent Person is satisfied that the assumptions used to determine the economic viability of the Ore Reserve is based on reasonable current data</p> <p>Sensitivity studies demonstrate standard linear deviations. The project is most susceptible to fluctuations in gold price.</p> |

## FINGALS FORTUNE

| Section 1: Sampling Techniques and Data |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| Sampling techniques                     | Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.                                                                                                                                                                                                                                        | <p>Drilling has been completed by numerous parties over the life of the project. Air core, RAB, reverse circulation, and diamond drilling have all been completed.</p> <p>Black Cat has completed both RC and diamond drilling, with extensional and infill drilling completed.</p> <p>Metallurgical samples have also been taken for recovery testing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                                         | Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>The majority of drilling was completed during the 1980's and early 1990s by Mistral Mines and the Mt Monger Gold Project JV. There is no reference to QAQC reported in annual reports for this period. Follow up drilling by Integra and Silver Lake indicate similar grades intercepted with acceptable QAQC reported.</p> <p>Black Cat's check drilling of historic results did not reveal issues with the historic results.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                                         | Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1m samples from which 3kg was pulverised to produce a 30g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information. | <p>Mistral Mines completed the bulk of exploration drilling for the Fingals Resource in 1990 using a Schramm RC drill rig. All samples were collected from the cyclone in bags for each metre drilled. Three metre composites samples were obtained by riffle splitting the 1m samples and combining into a 2kg composite sample. One metre samples were collected in bags from the cyclone and composited into a 2kg 3m composite sample using a riffle splitter. 1m resplit samples were taken where the 3m composite sample returned a grade above 0.2g/t Au.</p> <p>Analysis was completed at Classic Laboratories and Analabs in Kalgoorlie by fully pulverising the sample before splitting. A 50g charge was analysed by fire assay.</p> <p>Mt Monger Gold Project drilled the majority of the grade control drilling in 1991 using a 3 7/8 inch reverse circulation roller bit with a hammer and cross over sub for hard vein materials. Samples were bagged in 1m intervals and a 4m composite was collected by either riffle or spear sampling. Where assay values of greater than 0.2g/t Au were recorded, the intervals were re-split using a riffle splitter and re-assayed.</p> |

## Annual Mineral Resource and Ore Reserve Statement

| Section 1: Sampling Techniques and Data               |                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                                                       |                                                                                                                                                                                                                                                                                                                | <p>All samples were crushed, dried and pulverised and analysed using aqua regia digest with AAS finish due to check samples indicating fire assay produced similar results.</p> <p>Integra and Silver Lake sampling was completed in a similar manner with holes samples bagged on 1m intervals and composites of up to 4m completed. Anomalous intervals were then re-assayed with the 1m samples.</p> <p>Samples were tested in Genalysis Perth using a 10g charge and an aqua-regia digest with graphite furnace atomic absorption spectrometry finish.</p> <p>Black Cat's reverse circulation drilling is sampled into 1m intervals via a cone splitter on the rig producing a representative sample of approximately 3kg. Samples are selected to weigh less than 3kg to ensure total sample inclusion at the pulverisation stage. All samples are crushed, dried and pulverised to a nominal 90% passing 75µm to produce a 40g or 50g sub sample for analysis by FA/AAS.</p> <p>Black Cat's metallurgical samples were taken as 10kg composite samples from RC drilling completed since acquisition. Intervals were selected and speared from the green bags to form composite samples that are representative of the typical mineralisation observed at Fingals Fortune, split by oxidation type. Samples are then crushed to &lt;3.35mm and homogenised via rotary sample divider. The samples are then split for head assay tests, grind establishment tests, reserves and the main gravity/ leach test. The main sample is ground to 80% passing 106µm. Gravity separation is completed via a Knelson concentrator, with the gravity concentrate undergoing intensive leaching. The Knelson tails and intensive leach tails undergoes a 48-hour bottle roll test using site process water to determine the recovery.</p> |
| <b>Drilling techniques</b>                            | Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).                        | <p>RC drilling was completed using a face sampling percussion hammer.</p> <p>Diamond drilling was oriented and logged geotechnically.</p> <p>Historical RC drilling size is unknown.</p> <p>Black Cat's RC drilling was completed using a face sampling percussion hammer.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Drill sample recovery</b>                          | Method of recording and assessing core and chip sample recoveries and results assessed.                                                                                                                                                                                                                        | <p>Mt Monger Gold Project annual reports state that RC drilling at Fingals Fortune was dry with good recovery and no issues observed. There is no discussion of recovery for Integra and Silver Lake drilling.</p> <p>Black Cat's RC drilling had recovery and sample dampness recorded as routine. There were no issues encountered.</p> <p>Diamond core was geologically and geotechnically logged with core loss noted during this process.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                                                       | Measures taken to maximise sample recovery and ensure representative nature of the samples.                                                                                                                                                                                                                    | Sample representativity was checked through the use of duplicates with acceptable results from Integra and Silver Lake. Repeats of assays for Mistral Mines did not indicate any issues.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                                                       | Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.                                                                                                                                               | There is no known relationship between sample recovery and grade for drilling completed at Fingals Fortune.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Logging</b>                                        | Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.<br>Whether logging is qualitative or quantitative in nature.<br>Core (or costean, channel, etc) photography. | <p>Logging of reverse circulation chips record lithology, mineralogy, texture, mineralisation, weathering, colour, alteration, veining and structure.</p> <p>Diamond core was geologically logged and sampled by for lithology, mineralogy, texture, mineralisation, weathering, colour, alteration, veining and structure.</p> <p>Chips from all Black Cat's holes are stored and photographed for future reference. These chip/core trays are archived in Kalgoorlie.</p> <p>No historic core or chips are available.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|                                                       | The total length and percentage of the relevant intersections logged.                                                                                                                                                                                                                                          | All relevant drilling has been logged in full.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Sub-sampling techniques and sample preparation</b> | If core, whether cut or sawn and whether quarter, half or all core taken.                                                                                                                                                                                                                                      | The historical sampling method for diamond core is not discussed in the annual reports. Diamond core represents a very small percentage of the overall samples used in the Mineral Resource. It is not considered to have a material impact on the global estimate presented.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                                                       | If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.                                                                                                                                                                                                                  | <p>All samples were bagged from the rig. Integra and Silver Lake samples were split on the rig, while Mistral and Mt Monger used a riffle splitter to take the 1m samples. Composites were created through both riffle splitters and spear sampling.</p> <p>All Black Cat's RC sampling to date have been cone split to 1m increments on the rig. The vast majority of sampling has been dry. Where wet samples have been encountered, the hole is conditioned and splitter cleaned to prevent downhole contamination.</p> <p>There sampling was generally dry as per Mt Monger's annual reports and Black Cat's logging.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

|                                            |                                                                                                                                                                                                                                  | Black Cat's sample preparation adheres to industry best practice. It is conducted by a commercial laboratory and involves oven drying, coarse crushing then total grinding to a size of 90% passing 75µm. Historic preparation of samples is unknown but assumed as industry standard.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|                                            | Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.                                                                                                                            | All subsampling activities are carried out by commercial laboratory and are considered to be satisfactory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                                            | Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second half sampling.                                                         | Integra Mining and Silver Lake used field duplicate samples to check the representativity of sampling. These were submitted for the same assay process as the original samples and the laboratory are unaware of such submissions. Mistral Mines had repeats completed with no issues identified in the review of the data.<br>Black Cat's reverse circulation field duplicate samples are carried out at a rate of 1:50 and are sampled directly from the on-board splitter on the rig. These are submitted for the same assay process as the original samples and the laboratory are unaware of such submissions.                                                                                                                                                                                                                                                                          |
|                                            | Whether sample sizes are appropriate to the grain size of the material being sampled.                                                                                                                                            | Sample sizes of between 2-3kg are considered to be appropriate for the deposit.<br>Black Cat sample sizes of 3kg are considered to be appropriate given the grain size (90% passing 75µm) of the material sampled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Quality of assay data and laboratory tests | The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.                                                                                 | All samples are analysed by an external laboratory. Mistral Mines used a 50g fire assay, Mt Monger used aqua regia digest with AAS finish due to check samples indicating fire assay produced similar results, and Integra Mining used 10g charge and an aqua-regia digest with graphite furnace atomic absorption spectrometry finish.<br>Black Cat samples are analysed by an external laboratory using a 40g fire assay with AAS finish. This method is considered suitable for determining gold concentrations in rock and is a total digest method.<br>These methods re considered suitable for determining gold concentrations in rock and are a total digest method.                                                                                                                                                                                                                  |
|                                            | For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. | No geophysical tools were used in this Mineral Resource.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|                                            | Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.                 | Integra Mining and Silver Lake had a full QAQC program, with standards, blanks and field duplicates submitted with each batch of samples. There have been no issues observed within the QAQC data.<br>Historic drilling had limited QAQC completed, limited to repeats of assays. Results were compared to close by modern drill holes and were similar in grade.<br>Black Cat's drilling adheres to strict QAQC protocols involving weighing of samples, collection of field duplicates and insertion of certified reference material (blanks and standards). QAQC data are checked against reference limits in the SQL database on import.<br>The laboratory performs a number of internal processes including repeats, standards and blanks. Analysis of this data displayed acceptable precision and accuracy. Historic QAQC procedures are unknown but assumed to be industry standard. |
| Verification of sampling and assaying      | The verification of significant intersections by either independent or alternative company personnel.                                                                                                                            | Significant intercepts are verified by database, geological and corporate staff.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                                            | The use of twinned holes.                                                                                                                                                                                                        | Diamond twinning has not been completed at this point. Close spaced drilling through the mined portion at grade control spacing provides insight into the continuity of mineralisation at short distance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                                            | Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.                                                                                                       | Data has been reviewed from the digital file to the hard copies of annual reports with limited errors observed at this point.<br>Black Cat's Logging is completed in the field on a table before being uploaded into an SQL database. Assay files are uploaded directly from the lab into the database. The database is managed by a third party.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                                            | Discuss any adjustment to assay data.                                                                                                                                                                                            | No adjustments have been made to the assay data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Location of data points                    | Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.                                                      | Survey control for Mistral and Mt Monger's drilling is not discussed in the annual reports and represents a risk to the Mineral Resource which is reflected in the classification.<br>Black Cat's drilling is marked out using a handheld GPS prior to drilling. Once complete, the hole collars are picked up by an external contractor using RTK GPS. Downhole surveys are conducted by the drilling contractor at the end of each hole using a down hole north seeking gyro.                                                                                                                                                                                                                                                                                                                                                                                                              |
|                                            | Specification of the grid system used.                                                                                                                                                                                           | Mistral and Mt Monger operated on local grid for the Mt Monger area (SQL) that has been converted to MGA 94 Zone 51 for estimation. Integra Mining and Silver Lake worked in MGA 94 Zone 51. All reported references are in MGA 94 Zone 51.<br>Black Cat uses the grid system GDA 1994 MGA Zone 51.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Annual Mineral Resource and Ore Reserve Statement

| Section 1: Sampling Techniques and Data                 |                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criteria                                                | JORC Code Explanation                                                                                                                                                                                                        | Commentary                                                                                                                                                                                                                                                                                                                                 |
|                                                         | Quality and adequacy of topographic control.                                                                                                                                                                                 | Topography has been defined by a topographic survey of the area, with all collars corrected to the surface for consistency in elevation during estimation.                                                                                                                                                                                 |
| Data spacing and distribution                           | Data spacing for reporting of Exploration Results.                                                                                                                                                                           | The nominal spacing ranges from 12.5m (northing) by 8.5m (easting) within the grade controlled areas (mostly mined) to 50m by 50m at the extremities of the deposit.                                                                                                                                                                       |
|                                                         | Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. | Kriging neighbourhood analysis indicates drill spacing is sufficient to support the modelling of geology and grade, estimation methodology and final classifications.                                                                                                                                                                      |
| Orientation of data in relation to geological structure | Whether sample compositing has been applied.                                                                                                                                                                                 | Drill hole data has been composited downhole to 1m prior to the geostatistical analysis, continuity modelling and grade estimation process. The compositing has been run within the respective mineralisation domains using these as hard boundaries.                                                                                      |
|                                                         | Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.                                                                   | Exploration drilling has generally been drilled towards the east at ~60 dip to intersect the mineralised zones, with a couple of holes drilled in different orientations. Grade control drilling (mostly now mined out) was drilled vertically. These orientations are acceptable given the low angle of dip the mineralisation has.       |
|                                                         | If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.                   | All drilling from surface has been drilled as close to perpendicular to the predicted orientation of stratigraphy as possible. This has reduced the risk of introducing a sampling bias as far as possible. No orientation-based sampling bias has been identified in the data at this point.                                              |
| Sample security                                         | The measures taken to ensure sample security.                                                                                                                                                                                | The sample security of the historic drilling in unknown but is expected to have been acceptable. Black Cat's samples prepared on site by Black Cat geological staff. Samples are selected, collected into tied calico bags and delivered to the laboratory by staff or contractors directly and there are no concerns with sample security |
| Audits or reviews                                       | The results of any audits or reviews of sampling techniques and data.                                                                                                                                                        | A review of all available information on sampling and procedures used from annual reports has been by Black Cat's technical team. Black Cat's procedures are regularly reviewed by technical staff.                                                                                                                                        |

| Section 2: Reporting of Exploration Results (Criteria listed in the preceding section also apply to this section.) |                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Criteria                                                                                                           | JORC Code Explanation                                                                                                                                                                                                                                                        | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Mineral tenement and land tenure status                                                                            | Type, reference name/number, location and ownership including agreements or material issues with third parties such as Joint Ventures, partnerships, overriding royalties, native title interests, historical sites, wilderness or national park and environmental settings. | The Fingals Fortune Mineral Resource is located on M26/357, M26/148, M26/248, and M26/364. Mining lease M26/248 is granted is held until 2029 and is renewable for a further 21 years on a continuing basis. Mining lease M26/148 is granted is held until 2030 and is renewable for a further 21 years on a continuing basis. Mining leases M26/357 and M26/364 are granted are held until 2033 and are renewable for a further 21 years on a continuing basis. All production is subject to a Western Australian state government Net Smelter Return ("NSR") royalty of 2.5%. A royalty of the sum of \$1.50 per dry tonne of Ore in respect of 70% of all ore mined from M 26/357 and either treated by CIP/CIL or sold before treatment is payable to a third party. There are no registered Aboriginal Heritage sites or pastoral compensation agreements over the tenements.                                                                                                                                                                                                                                                                                                                                                 |

| Exploration done by other parties                                                                                  | Acknowledgment and appraisal of exploration by other parties.                                                                                                                                                                                                                | Fingals Fortune was first identified by Geopeko in joint venture with Mistral Mines in 1983-1984 through a systematic soil geochemical sampling program. This was followed up with costeans, RAB and RC drilling. Geopeko did not perceive the discoveries to be of sufficient size and withdrew from the joint venture in 1986. Mistral Mines continued to explore and define Fingals Fortune, producing a feasibility study in the 1990. During this time, the tenement directly south of Fingals Fortune (now M26/357) was lost to Mistral though an administrative error resulting in the pegging by a prospector. Following Mistral Mines falling into receivership, the project was acquired by Ramsgate Resources, who formed the Mt Monger Gold Project JV with General Gold in 1991. M26/357 was repurchased from Bond Gold Australia and Dragon Resources in 1992. The Fingals Fortune deposit was subsequently mined in 1992 and 1993 by the Mt Monger Gold Project JV, with minor exploration around the area continuing until divestment. Since mining was completed, Exploration of the Fingals Fortune deposit has been sporadic with various companies drilling holes to test the potential of reopening the mine: |

## Annual Mineral Resource and Ore Reserve Statement

| Section 2: Reporting of Exploration Results (Criteria listed in the preceding section also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

The geological sequence is comprised of mafic units of Hi-Mg basalts to pyroxenite gabbroic composition that occupy the core of the anticline, with bedding parallel intrusive dolerite sills and cross cutting quartz-feldspar porphyries.</p> <p>The Fingals Fortune deposit is situated on the western limb of the anticline dipping at ~30–40 degrees to the southwest. Hi-Mg pillow basalts are positioned in the footwall of the deposit and structurally separated from overlying dolerite sills and basalts by a structural discontinuity represented by a series of bedding parallel shears.</p> <p>The shearing strikes at 315–320 degrees and display intense hydrothermal alteration with bleached sericite and pyrite with associated silicification and carbonate alteration. The shear zones anastomose with thicknesses ranging between 1m – 6m and are host to a series of stacked quartz veins that host mineralisation. The quartz veins within the shear zones are boudinaged with boudin necks plunging 60–70° to the northeast. Flat lying quartz veins are also developed as tensional structures between the thrust zones.</p> <p>Northwest striking quartz-feldspar porphyry dykes post-date the mafic sequence although they exhibit signs of shearing and thus occur prior to the regional axial planar foliation fabrics and greenschist metamorphism.</p> <p>A northeast (070°) striking fault that postdates the west dipping sericite shear zones occurs within the middle of the Fingals Fortune pits. This coincides with a change in strike of the shear zones and is associated with elevated gold grades.</p> <p>A deep weathering profile exists across the deposit down to 60m in places with supergene mineralisation occurring at various horizons</p> |

| <b>Relationship between mineralisation widths and intercept lengths</b>                                            | <p>These relationships are particularly important in the reporting of Exploration Results.</p> <p>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | No exploration results reported within this announcement                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Annual Mineral Resource and Ore Reserve Statement

| Section 2: Reporting of Exploration Results (Criteria listed in the preceding section also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                      |
|--------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criteria                                                                                                           | JORC Code Explanation                                                                                                                                                                                                                                                                                                                                                                 | Commentary                                                                                                                                                                                                                           |
|                                                                                                                    | If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').                                                                                                                                                                                                                     |                                                                                                                                                                                                                                      |
| <b>Diagrams</b>                                                                                                    | Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include but not be limited to a plan view of drill hole collar locations and appropriate sectional views.                                                                                                                     | Appropriate diagrams were released at time of Resource announcement. Refer to the relevant Resource Announcement listed in Notes on Resources under Gold Resource Table of this announcement.                                        |
| <b>Balanced reporting</b>                                                                                          | Where comprehensive reporting of all Exploration Results is not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.                                                                                                                                                             | No exploration results reported within this announcement.                                                                                                                                                                            |
| <b>Other substantive exploration data</b>                                                                          | Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. | Geophysical surveys including aeromagnetic surveys have been carried out by previous owners to highlight and interpret prospective structures in the project area. No geophysics was used in the production of the Mineral Resource. |
| <b>Further work</b>                                                                                                | The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling). Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.                                              | Black Cat plans to conduct continue exploration in the area to confirm the current interpretation and target extensions to the currently modelled mineralisation.                                                                    |

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criteria                                                                                                                                              | JORC Code Explanation                                                                                                                                                                                                            | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Database integrity</b>                                                                                                                             | Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes. Data validation procedures used. | <p>The data used for generating the Mineral Resource estimates is stored in an Acquire database. The Company employs a database administrator to manage the database.</p> <p>Where possible, raw data is loaded directly into the database. Extensive validation checks are built into the Acquire database to ensure data integrity and the data uploaded is date stamped with a user identifier. Data is also interrogated in 3D space to ensure that the location, geology and assays match surrounding holes.</p> <p>Checks carried out on the imported Black Cat data include:</p> <ul style="list-style-type: none"> <li>• Collar details import checks – start and end dates are supplied, collar has location coordinates, end of hole information has been updated from plan.</li> <li>• Survey details import checks – surveys are approved in Index and once approved, uploaded to Acquire. Checks are made to compare the planned dip and azimuth to the actual dip and azimuth to ensure the correct data is approved and uploaded.</li> <li>• Geology details import checks – final lithology depth is within tolerance with respect to end of hole depth, structural measurements are present, and no overlapping intervals exist.</li> <li>• Sample/Assay import checks – total sample metres match end of holed depth, no duplicate samples with the same priority exist, sample intervals are continuous, no assay values have negative values, despatch return date is recorded, QAQC checks have passed.</li> <li>• Geotechnical details import checks – logged information depths are within tolerance with respect to end of hole depth.</li> <li>• Bulk Density/SG detail checks – logged information depths are within tolerance with respect to end of hole depth.</li> </ul> <p>Errors are corrected where possible. When not possible, the data is flagged as 'invalid' in the database and excluded from the estimation process.</p> |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

|                                                                                                                                                       |                       | <ul style="list-style-type: none"> <li>The influence of extreme gold assays has been reduced by top-cutting across 5 selected domains. The top-cut thresholds have been determined using a combination of histograms, log-probability and mean-variance plots. Top-cuts have been reviewed and applied to the composites on a domain-by-domain basis.</li> <li>Outlier restrictions using the clamping option in Leapfrog Edge has been used where outliers were observed but CV values were considered benign on 14 domains.</li> <li>Search ellipse orientation and size were based on variogram rotations and variogram ranges on a domain by domain basis. Lodes that did not have enough samples to calculate a realistic variogram were assigned the variogram of a similar oriented lode or were grouped with a similar corresponding lode to generate a combined variogram.</li> </ul> <p>Top-cuts were applied to the composited sample data with the intention of reducing the impact of outlier values on the average grade. Top cuts were selected based on a statistical analysis of the data with a general aim of not impacting the mean by more than 10% and reducing the coefficient of variation to around 2 and vary by domain.</p> <p>An initial top cut is applied to domains with extreme outliers. Samples that sit above this top cut value are then re-coded as this value. Some domains also required clamping, a technique to reduce the extent of samples above a particular grade</p> <p>Comparison estimates were carried out by Inverse Distance Cubed method for a number of more significant model domains alongside the Ordinary Kriged estimates.</p> <p>No assumptions are made on recovery of by-products.</p> <p>No other elements were estimated.</p> <p>The block model parent block size is 10.0 m (X) by 10.0 m (Y) by 5 m (Z) and sub-blocks down to 1.25 m (X) by 1.25 m (Y) by 0.625 m (Z), with the sub-blocks estimated at the scale of the parent block. The block size is considered appropriate for the drillhole spacing throughout the deposit.</p> <p>Average drill spacing ranges from 10.0m x 10.0m, down to 60m x 60m at mineralisation depths and extents.</p> <p>Grade estimation has been completed in four estimation passes with the requirements for filling blocks in each pass summarised as;</p> <ul style="list-style-type: none"> <li>Pass 1 estimations have been undertaken using a minimum of 12 and a maximum of 20 composites into a search ellipsoid with dimensions equal to one half of the variogram of the most continuous domain within the deposit. Rotations have been applied on a domain by domain basis taken from the wireframe orientation and variogram.</li> <li>Pass 2 estimations have been undertaken using a minimum of 6 and a maximum of 20 composites into a search ellipsoid with dimensions equal to twice the first pass.</li> <li>Pass 3 estimations have been undertaken using a minimum of 4 and a maximum of 10 composites into a search ellipsoid equal to the twice the second pass.</li> <li>Variable search orientations were applied to all domain estimators based on the structural interpretation of the Fingals mineralisation.</li> </ul> <p>No selective mining units were assumed in the resource estimate.</p> <p>No assumptions about correlation between variables was made. Gold was estimated independently, and density was hard-coded into the model based on the oxide-transitional-fresh contacts.</p> <p>Statistics are generated and analysed using Snowden Supervisor software for the raw, composited and capped and composited drill hole files to ensure the nature of the population has not been adversely affected by these processes.</p> |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Mining factors or assumptions</b>                                                                                                                  | Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.                                                                                                                           | <p>The assumption has been made that with the geometry and shallow nature of the mineralisation, mining is likely to continue to be undertaken as an open pit technique.</p> <p>No minimum width is applied to the resource. Minimum widths are assessed and applied using Whittle and Mining Shape Optimiser software during the Reserve estimation process.</p> <p>It is assumed that planned dilution is factored into the process at the stage of Reserve estimation and stope design planning.</p> <p>For the assumption of reasonable prospect of mining the following parameters have been selected for the generation of an optimisation shell;</p> <ul style="list-style-type: none"> <li>\$AUD 6,000 gold price</li> <li>3.0% Royalty (2.5% state &amp; 0.5% Maximus)</li> <li>~30% Dilution via MSO calculation</li> <li>5% Ore loss</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Metallurgical factors or assumptions</b>                                                                                                           | The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.                                                                                                                                                       | <p>Assumed the material will be trucked and processed at Black Cat's own mill. Recovery factors are assigned based on lab test work, and on-going experience.</p> <p>No metallurgical assumptions have been built or applied to the Resource model.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Environmental factors or assumptions</b>                                                                                                           | Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made. | <p>A "Licence to Operate" is held by the operation which is issued under the requirement of the "Environmental Protection Act 1986", administered by the Department of Environment (DoE). The licence stipulates environmental conditions for the control of air quality, solid waste management, water quality, and general conditions for operation. Groundwater licenses are held for water abstraction, including production bore field water use for mineral processing, and mine dewatering, in accordance with the Rights in Water and Irrigation Act 1914. These licenses are also regulated by DoE and are renewable on a regular basis. Black Cat Syndicate conduct extensive environmental monitoring and management programs to ensure compliance with the requirements of the licences and lease conditions.</p> <p>The Kalgoorlie operations are fully permitted including groundwater extraction and dewatering, removal of vegetation, mineral processing, and open pits.</p> <p>A conventional storage facility is used for the process plant tailings.</p> <p>Waste rock is to be stored in a traditional waste rock landform 'waste dump'. There is no evidence from previous mining to indicate the presence of deleterious elements within the Fingals deposit.</p> |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Bulk density</b>                                                                                                                                   | Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.<br>The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.<br>Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.                                                                                                                                                                                                                                                                                                                                                                | Bulk density is assigned based on regolith. Values of 1.70, 2.20 and 2.80 t/m <sup>3</sup> are used for oxide, transitional and fresh waste rock respectively.<br><br>Bulk density values were taken from limited Black Cat diamond drilling, and historic test work using the Archimedes method. Recent diamond drilling at Fingals focused on increasing the number of density samples within the oxide. The results correlate well with results from other areas in the region with similar geology. Further work on density will be completed as the project progresses.<br><br>Density values are allocated uniformly to each regolith type.                                                                                                                                                                                                                                                                                 |
| <b>Classification</b>                                                                                                                                 | The basis for the classification of the Mineral Resources into varying confidence categories.<br>Whether appropriate account has been taken of all relevant factors (i.e. relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).<br>Whether the result appropriately reflects the Competent Person's view of the deposit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | There is no Measured Mineral Resources at Fingals Fortune.<br><br>Indicated mineralisation was classified based on material that has previously been grade controlled below the current mined pit, along with material drilled by Black Cat to at least 25m by 25m drill spacing.<br><br>Inferred mineral resources are based on limited data support. No development for geological mapping; typically drill spacing greater than 25m x 25m (down to 100m x 100m at resource extents).<br><br>Further considerations of resource classification include; Data type and quality (drilling type, drilling orientations, down hole surveys, sampling and assaying methods); Geological mapping and understanding; statistical performance including number of samples, slope regression and kriging efficiency.<br><br>The classification of the Mineral Resource estimate appropriately reflects the view of the Competent Person. |
| <b>Audits or reviews</b>                                                                                                                              | The results of any audits or reviews of Mineral Resource estimates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | The geological interpretation, estimation parameters and validation of the Resource model were peer reviewed by Black Cat staff prior to accepting the responsibility for the Mineral Resource.<br><br>No external reviews of the Resource estimate had been carried out at the time of writing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Discussion of relative accuracy/ confidence</b>                                                                                                    | Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.<br>The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.<br>These statements of relative accuracy and confidence of the estimate should be compared with production data, where available. | The relative accuracy of the Mineral Resource estimate is reflected in the reporting of the Mineral Resource as per the guidelines of the 2012 JORC Code.<br><br>The relative accuracy and confidence of the mineral resource model is reflected in the assigned Mineral Resource classifications. The Fingals deposit is a global estimate. No reconciliation factors are applied to the resource post-modelling.<br><br>Due to observed variability in historic drilling within the mined pit, the western structures below this have been drilled on 12.5m lines with 25m between lines to test continuity. This work indicates that a standard 25m by 25m pattern is sufficient over most of the deposit to classify as Indicated.                                                                                                                                                                                            |

| Section 4: Estimation and Reporting of Ore Reserves             |                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                |

| <b>Study status</b>                                 | The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.<br>The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | The level of study is to Feasibility Study accuracy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Cut-off parameters</b>                           | The basis of the cut-off grade(s) or quality parameters applied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Breakeven cut-off grades were calculated using planned mining costs. The breakeven cut-off included mining costs, surface haulage, processing, and administration costs.<br><br>A Reserve cut-off grade of 0.4g/t has been used for open pit estimations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Mining factors or assumptions</b>                | <p>The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).</p> <p>The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.</p> <p>The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc.), grade control and pre-production drilling.</p> <p>The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).</p> <p>The mining dilution factors used.</p> <p>The mining recovery factors used. Any minimum mining widths used.</p> <p>The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.</p> <p>The infrastructure requirements of the selected mining methods.</p> | <p>The operating open pit design was selected as the basis for the Reserve estimate.</p> <p>Open pit mining assumed a top down drill and blast and load and haul method on 5m benches, mined over two flitches. Drill and blast requirements assumed 50% blasting in oxide rock and 100% blasting in transitional and fresh rock. Associated design issues such as pre-strip, access, etc were considered in designing the mine</p> <p>Geotechnical assessments of the rock mass were conducted and pit design parameters were recommended by an external consultant.</p> <p>Required grade control requirements were calculated by designing a life of mine grade control drilling program with contractor costs applied.</p> <p>The Fingals Fortune Mineral Resource Model was used for the open pit assessment.</p> <p>Mining dilution was applied to the Resource Model by reblocking the Resource to regularized blocks 2.5mX x 5mY x 2.5mZ.</p> <p>An open pit mining recovery factor of 95% was applied to account for unplanned ore loss. Minimum ore mining width equals 2.5m, minimum working width is ~20m.</p> <p>No Inferred Mineral Resource is considered in the mining study. Inferred Mineral Resource was assigned a grade of 0.01g/t before pit open pit optimisations or mining dilution was considered</p> <p>The existing site layout was used in the mining study. The site layout considers the location, size and design criteria for waste dumps. The site layout also considers abandonment bund location, communication requirements, explosives storage, office requirements, ore storage facilities, roads, surface water, workshops, etc.</p> |
| <b>Metallurgical factors or assumptions</b>         | <p>The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.</p> <p>Whether the metallurgical process is well-tested technology or novel in nature.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>The metallurgical process proposed is two stage crushing and milling to 106µm with gravity recovery and carbon in leach extraction at Black Cat's Lakewood Gold Processing Facility.</p> <p>The metallurgical process is well tested and commonly used in similar operations worldwide.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Annual Mineral Resource and Ore Reserve Statement

| Section 4: Estimation and Reporting of Ore Reserves |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                           |

There must be reasonable grounds to expect that all necessary Government approvals will be received within the timeframes anticipated in the Pre-Feasibility or Feasibility Study. Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.                                                                                                                                                                                                                                                              | No identifiable naturally occurring risks have been identified to impact the Ore Reserves.<br><br>All legal and marketing agreements are in place.<br><br>The mine is fully approved and operating.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Classification</b>                               | The basis for the classification of the Ore Reserves into varying confidence categories.<br>Whether the result appropriately reflects the Competent Person's view of the deposit.<br>The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Mineral Resources converted to Ore Reserves as per JORC 2012 guidelines, i.e. Measured to Proved, Indicated to Probable.<br>No downgrading in category has occurred for this project.<br><br>The result reflects the Competent Person's view of the deposit.<br><br>No Probable Ore Reserves are derived from Measured Mineral Resources at this date.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Audits or reviews</b>                            | The results of any audits or reviews of Ore Reserve estimates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | The Ore Reserve has undergone internal peer review.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Discussion of relative accuracy/ confidence</b>  | Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.<br>The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.<br>Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage. | The mine designs, schedule and financial model for the Ore Reserve have been completed to a Pre-Feasibility standard with level of confidence equal to or better than +/-25% level of confidence.<br><br>Metallurgical recoveries have been based on metallurgical test work from the Fingals Fortune deposit using site water at the nominated grind size, with recoveries verified by historic mining.<br><br>Costs have been estimated by the Competent Person from budget quotations, factored estimates, or cost data from similar operations/ projects.<br><br>A degree of uncertainty is associated with geological estimates and the Ore Reserve classification reflects the level of confidence in the Mineral Resource.<br><br>There is a degree of uncertainty regarding estimates of modifying mining factors, geotechnical and processing parameters and the Ore Reserve classification reflects the level of confidence of the study.<br><br>The Competent Person is satisfied that the current gold price is sufficient that the Ore Reserve estimate would remain economically viable with any negative impacts applied to these factors or parameters. |

## Annual Mineral Resource and Ore Reserve Statement

| Section 4: Estimation and Reporting of Ore Reserves |                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                           |

| Sampling techniques                     | Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.                                                                                                                                                                                                                                        | Previous drilling has been completed by Integra and Silver Lake Resources. Air core, RAB, reverse circulation, and diamond drilling have all been completed.<br>Black Cat has completed a program of RC and diamond drilling to test historic drilling and extend the mineralisation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|                                         | Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.                                                                                                                                                                                                                                                                                                                                                                                                                       | The majority of drilling was completed during the last 12 years by Integra and then Silver Lake. QAQC was completed with acceptable results.<br>Drilling by Black Cat has produced similar results and does not reveal any issues with previous drilling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                         | Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1m samples from which 3kg was pulverised to produce a 30g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems.<br>Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information. | For Integra and Silver Lake: Drill cuttings were extracted from the RC return via cyclone. The underflow from each 1m interval was transferred via bucket to a 75/12.5/12.5% riffle splitter, delivering approximately three kilograms of the recovered material into calico bags for analysis. 1m samples were collected throughout the entire drill hole. 3m composites samples were collected with a spear, in low priority areas, and these samples were submitted for analysis. Any composite assays returning anomalous intersections were resampled using the 1m sample collected during drilling.<br><br>All NQ2 diamond holes were half-core sampled over prospective mineralised intervals determined by the geologist. Within fresh rock, core was oriented for structural/geotechnical logging wherever possible. In oriented core, one half of the core was sampled over intervals ranging from 0.3m to 1.2m and submitted for fire assay analysis for gold. The remaining core, including the bottom of-hole orientation line, was retained for geological reference and potential further sampling such as metallurgical test work. In intervals of un-oriented core, the same half of the core has been sampled where possible, by extending a cut line from oriented intervals through into the un-oriented intervals. The lack of a consistent geological reference plane, (such as bedding or a foliation), precludes using geological features to orient the core. All diamond holes were surveyed during drilling with down hole single shot cameras, and the majority of drill holes were resurveyed at the completion of the drill hole using a collar orientated Gyro Inclinator at 10m intervals.<br><br>For Black Cat: Reverse circulation drilling is sampled into 1m intervals via a cone splitter on the rig producing a representative sample of approximately 2-3kg. Samples are selected to weigh less than 3kg to ensure total sample inclusion at the pulverisation stage. All samples are crushed, dried and pulverised to a nominal 90% passing 75µm to produce a 40g or 50g sub sample for analysis by FA/AAS. All NQ2 diamond holes are half core sampled over the entire length of the hole to geological contacts. Sample lengths range from 0.2-1.2m, with the same half consistently taken where possible to reduce any human bias in sampling. Core is orientated where possible for structural and geotechnical logging. All holes are surveyed by downhole north-seeking gyro, and collars are picked up by RTK GPS by a chartered survey contractor. |
| Drilling techniques                     | Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).                                                                                                                                                                                                                                                                                 | All RC drilling was completed using a face sampling percussion hammer. All diamond drilling was NQ2 and oriented and logged geotechnically where possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Annual Mineral Resource and Ore Reserve Statement

| Section 1: Sampling Techniques and Data        |                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Criteria                                       | JORC Code Explanation                                                                                                                                                                                                                                                                                          | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Drill sample recovery                          | Method of recording and assessing core and chip sample recoveries and results assessed.                                                                                                                                                                                                                        | For all drilling, RC sample recovery is recorded at 1m intervals to assess that the sample is being adequately recovered during recover drilling operations. A subjective visual estimate is used and recorded as a percentage. Sample recovery is generally good, and there is no indication that sampling presents a material risk for the quality of the evaluation of the Imperial deposit. For diamond drilling recovered core for each drill run is recorded and measured against the expected core from that run. Core recovery is consistently very high, with minor loss occurring in regolith and heavily fractured ground. There is no indication that sampling presents a material risk for the quality of the evaluation of the Imperial deposit.                                                                                                                                                                                                                                                                                         |
|                                                | Measures taken to maximise sample recovery and ensure representative nature of the samples.                                                                                                                                                                                                                    | Sample representativity was checked through the use of duplicates with acceptable results throughout the life of the project.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                                | Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.                                                                                                                                               | There is no known relationship between sample recovery and grade for drilling completed by Black Cat. Any historical relationship is not known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Logging                                        | Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.<br>Whether logging is qualitative or quantitative in nature.<br>Core (or costean, channel, etc) photography. | Logging of reverse circulation chips record lithology, mineralogy, texture, mineralisation, weathering, colour, alteration, veining and structure. Diamond core was geologically logged and sampled by for lithology, mineralogy, texture, mineralisation, weathering, colour, alteration, veining and structure. Chips from all Black Cat's holes are stored and photographed for future reference. These chip/core trays are archived in Kalgoorlie. The majority of diamond drilling completed by Integra and Silver Lake has been photographed, and the core is stored in the core farm.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                                                | The total length and percentage of the relevant intersections logged                                                                                                                                                                                                                                           | All relevant drilling has been logged in full.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Sub-sampling techniques and sample preparation | If core, whether cut or sawn and whether quarter, half or all core taken.                                                                                                                                                                                                                                      | All diamond core is sawn half core using a diamond-blade saw, with the same half of the core consistently taken for analysis. The un-sampled half of diamond core is retained for check sampling if required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                                | If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.                                                                                                                                                                                                                  | For Integra and Silver Lake: Drill cuttings are extracted from the RC return via cyclone. The underflow from each 1 m interval is transferred via bucket to a 75/12.5/12.5% riffle splitter, delivering approximately three kilograms of the recovered material into calico bags for analysis. Sample moisture (i.e. whether dry, moist, wet) is logged. For Black Cat: RC sampling is cone split to 1m increments on the rig. The vast majority of sampling has been dry. Where wet samples have been encountered, the hole is conditioned and splitter cleaned to prevent downhole contamination.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                                                | For all sample types, the nature, quality and appropriateness of the sample preparation technique.                                                                                                                                                                                                             | For Integra and Silver Lake: All samples are sorted and dried upon arrival to ensure they are free of moisture prior to pulverising. Samples that are too coarse to fit directly into a pulverising vessel will require coarse crushing to nominal 10mm. Samples >3kg are sub split to a size that can be effectively pulverised. Representative sample volume reduction is achieved by either riffle splitting for free flowing material or rotary splitting for pre crushed (2mm) product. All samples are pulverised utilising 300g, 1000g, 2000g and 3000g grinding vessels determined by the size of the sample. A grind quality target of 85% passing 75µm has been established and is relative to sample size, type and hardness. MinAnalytical utilises low chrome steel bowls for pulverising. On completion of analysis all solid samples are stored for 60 days.<br><br>Black Cat's sample preparation is conducted by a commercial laboratory and involves oven drying, coarse crushing then total grinding to a size of 90% passing 75µm. |
|                                                | Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.                                                                                                                                                                                                          | All subsampling activities are carried out by commercial laboratory and are considered to be satisfactory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                                                | Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second half sampling.                                                                                                                                       | For all RC drilling, field duplicate samples are carried out at a rate of 1:50 and are sampled directly from the on-board splitter on the rig. These are submitted for the same assay process as the original samples and the laboratory are unaware of such submissions.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|                                                | Whether sample sizes are appropriate to the grain size of the material being sampled.                                                                                                                                                                                                                          | Sample sizes of between 2-3kg are considered to be appropriate for the deposit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Quality of assay data and laboratory tests     | The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.                                                                                                                                                               | All samples are analysed by an external laboratory. Integra and Silver Lake used a 50g fire assay with AAS finish for gold analysis. Cu has been assayed using a 10g Charge - Aqua-Regia digest with Inductively Coupled Plasma Optical Emission Spectrometry. Black Cat samples are analysed by an external laboratory using a 40g fire assay with AAS finish. This method is considered suitable for determining gold concentrations in rock and is a total digest method. These methods re considered suitable for determining gold concentrations in rock and are a total digest method.                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Annual Mineral Resource and Ore Reserve Statement

| Section 1: Sampling Techniques and Data                 |                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                                                         | For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. | No geophysical tools were used in this Imperial Resource update.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|                                                         | Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.                     | Integra Mining and Silver Lake had a full QAQC program, with standards, blanks and field duplicates submitted with each batch of samples. There have been no issues observed within the QAQC data. Black Cat's drilling adheres to strict QAQC protocols involving weighing of samples, collection of field duplicates and insertion of certified reference material (blanks and standards). QAQC data are checked against reference limits in the SQL database on import. The laboratory performs a number of internal processes including repeats, standards and blanks. Analysis of this data displayed acceptable precision and accuracy. Historic QAQC procedures are unknown but assumed to be industry standard. |
| Verification of sampling and assaying                   | The verification of significant intersections by either independent or alternative company personnel.                                                                                                                            | Significant intercepts are verified by database, geological and corporate staff.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|                                                         | The use of twinned holes.                                                                                                                                                                                                        | A number of twinned holes have been completed at the deposits. While the twinning has highlighted the variable and nuggety nature of the mineralisation, no issues have been observed in representativity of sampling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                                                         | Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.                                                                                                       | All logging is completed in the field on a table before being uploaded into an SQL database. Assay files are uploaded directly from the lab into the database. The database is managed by a third party.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Location of data points                                 | Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.                                                      | All drilling is marked out using a handheld GPS prior to drilling. Once complete, the hole collars are picked up by an external contractor using RTK GPS. Downhole surveys are conducted by the drilling contractor at the end of each hole using a down hole north seeking gyro.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|                                                         | Specification of the grid system used.                                                                                                                                                                                           | All drilling is completed using the grid system GDA 1994 MGA Zone 51.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                                                         | Quality and adequacy of topographic control.                                                                                                                                                                                     | Topography has been defined by drill hole collars, with the mined pits picked up by survey.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Data spacing and distribution                           | Data spacing for reporting of Exploration Results.                                                                                                                                                                               | The nominal spacing ranges from 25 by 25 to generally 50m by 50m for Au. Cu sampling has been selectively completed on an approximate 50m by 50m grid targeting zones of higher gold within some holes within the mined open pits, extending below the mined pits by approximately 100-150m.                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                                                         | Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.     | It is sufficient.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Orientation of data in relation to geological structure | Whether sample compositing has been applied.                                                                                                                                                                                     | Drill hole data has been composited downhole to 1m prior to the geostatistical analysis, continuity modelling and grade estimation process. The compositing has been run within the respective mineralisation domains using these as hard boundaries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                                                         | Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.                                                                       | Exploration drilling has generally been drilled towards the east at -60 to intersect the mineralised zones, with a couple of holes drilled in different orientations. A number of holes were drilled down dip which have been excluded from estimation. Grade control drilling (fully mined out) was drilled at -60 to the east. These orientations are acceptable given the angle of dip the mineralisation has.                                                                                                                                                                                                                                                                                                       |
|                                                         | If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.                       | All samples are prepared on site by company geological staff. Samples are selected, collected into tied calico bags and delivered to the laboratory by staff or contractors directly and there are no concerns with sample security                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Sample security                                         | The measures taken to ensure sample security.                                                                                                                                                                                    | Black Cat's samples prepared on site by Black Cat's geological staff. Samples are selected, collected into tied calico bags and delivered to the laboratory by staff or contractors directly and there are no concerns with sample security.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Audits or reviews                                       | The results of any audits or reviews of sampling techniques and data.                                                                                                                                                            | A review of all available information on sampling and procedures used from Integra and Silver Lake has been reviewed by Black Cat's technical team. Black Cat's procedures are regularly reviewed by technical staff.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## Annual Mineral Resource and Ore Reserve Statement

| Section 2: Reporting of Exploration Results (Criteria listed in the preceding section also apply to this section.) |                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Regionally, Imperial sits within a zone of the volcanic and volcanoclastic felsics that form part of the Eastern Goldfields Superterrane greenstone. The area is bounded to the east by the Juglah Monzogranite - an oval-shaped intrusion emplaced into a domed sequence of felsic to intermediate volcanoclastic and volcanic rocks. To the south, the area is cut by a series of dolerite and gabbro dykes running ENE that form part of the Widgiemooltha Supersuite. Locally, Imperial deposit occurs within a quartz diorite on the western margin of the Juglah Monzogranite. The Quartz diorite is relatively equigranular and contains up to 10% quartz. Numerous mafic clots up to 1cm in diameter punctuate the rock made up of biotite. A deep weathering profile exists across the deposit down to 60m in places and displays weak supergene mineralisation above 35m that sits directly below a stripped zone of mineralisation. Imperial is dominated by generally north-south, steeply west dipping structures. Within these structures, two plunges have been identified, both within drill core measurements, and grade distributions:</p> <ul style="list-style-type: none"> <li>• Very gentle north to very gentle south plunge identified within vein intersections containing sulphides, alteration contacts and progressively higher gold grade cut-offs. All these features show a visual correlation with domains of strongly elevated gold grades.</li> <li>• A moderate southwest plunge within veins that contain various silicate infill minerals, alteration contacts, lithological contacts, shears, sulphide bearing veins, late faults and areas of moderately elevated gold grades.</li> </ul> <p>These structures are believed to have been the primary control on mineralisation orientation. Two styles of mineralisation are observed within the area. An earlier biotite-pyrite wash, and a later state bleaching (albite silica-pyrite).</p> <p>Features of the two styles include: • •</p> <p>Biotite-pyrite mineralisation:</p> <ul style="list-style-type: none"> <li>• Spatial association with porphyritic dykes;</li> <li>• Elevated gold generally associated with increase in pyrite content;</li> <li>• Increased biotite fractures/brecciation indicate elevated gold.</li> </ul> <p>Albite-silica-pyrite mineralisation:</p> <ul style="list-style-type: none"> <li>• Elevated gold and copper associated with increased pyrite content;</li> <li>• Commonly associated with quartz-sulphide veining with albite alteration halos;</li> <li>• Later stage non mineralised albite-silica alteration overprints mineralised veins.</li> </ul> <p>Based on fluid inclusion work, mineralising fluids are thought to be derived from a magmatic derived fluid source. Changes in composition are thought to be due to a slowly cooling system. Mineralisation appears to have occurred relatively early, with later stage veining and alteration overprinting mineralised structures.</p> |
| Drill hole information                                                                                             | A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:<br>– easting and northing of the drill hole collar;                                                  | All the drill hole data was used directly or indirectly for the preparation of the resource estimates described in the resource report. Exclusion of the drill information will not detract from the understanding of the report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Annual Mineral Resource and Ore Reserve Statement

| Section 2: Reporting of Exploration Results (Criteria listed in the preceding section also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                      |

| Criteria                                                                                                           | JORC Code Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Commentary                                                                                                                                                                                                                           |
|                                                                                                                    | <ul style="list-style-type: none"> <li>elevation or Reduced Level ("RL") (elevation above sea level in metres) of the drill hole collar;</li> <li>dip and azimuth of the hole;</li> <li>down hole length and interception depth;</li> <li>hole length; and</li> <li>if the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li> </ul> |                                                                                                                                                                                                                                      |
| Data aggregation methods                                                                                           | In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high-grades) and cut-off grades are usually Material and should be stated.                                                                                                                                                                                                                                                                                                                         | No exploration results reported within this announcement                                                                                                                                                                             |
|                                                                                                                    | Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.                                                                                                                                                                                                                                                                         | No exploration results reported within this announcement                                                                                                                                                                             |
|                                                                                                                    | The assumptions used for any reporting of metal equivalent values should be clearly stated.                                                                                                                                                                                                                                                                                                                                                                                                                                    | Not applicable, as no metal equivalent values have been reported.                                                                                                                                                                    |
| Relationship between mineralisation widths and intercept lengths                                                   | These relationships are particularly important in the reporting of Exploration Results.<br>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.<br>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').                                                                                                                                              | No exploration results reported within this announcement                                                                                                                                                                             |
| Diagrams                                                                                                           | Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.                                                                                                                                                                                                                                                              | Appropriate diagrams were released at time of Resource announcement. Refer to the relevant Resource Announcement listed in Notes on Resources under Gold Resource Table of this announcement.                                        |
| Balanced reporting                                                                                                 | Where comprehensive reporting of all Exploration.<br>Results are not practicable, representative reporting of both low and high-grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.                                                                                                                                                                                                                                                                                                 | No exploration results reported within this announcement                                                                                                                                                                             |
| Other substantive exploration data                                                                                 | Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.                                                                                                                                          | Geophysical surveys including aeromagnetic surveys have been carried out by previous owners to highlight and interpret prospective structures in the project area. No geophysics was used in the production of the Mineral Resource. |
| Further work                                                                                                       | The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).<br>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.                                                                                                                                                                                      | Black Cat plans to conduct continue exploration in the area to confirm the current interpretation and target extensions to the currently modelled mineralisation.                                                                    |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

The geological interpretation of Imperial/Majestic has considered all available geological information. RC and Diamond drilling was used during interpretation with the exclusion of RAB and AC due to the lack of confidence in the technique for modelling and estimation. Mineralisation was modelled as a series of narrow veins with a generally north-south strike and a moderate to steep dip to the west. Porphyries were also modelled to assist in the interpretation and identify potential areas of faulting. Wireframes of the mineralisation were constructed using cross sectional interpretations based on a 0.4 g/t Au cut-off grade with no minimum downhole length. Due to the nuggety nature of the structures in places, grades lower than this were included where there was geological evidence for the continuation of the structures.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Dimensions</b>                                                                                                                                     | The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | The Imperial Resources extend over a strike length of 550m, is a zone of lodes 266m wide and extends to a vertical depth of 200m below surface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Estimation and modelling techniques</b>                                                                                                            | The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.<br>The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.<br>The assumptions made regarding recovery of by-products.<br>Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).<br>In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.<br>Any assumptions behind modelling of selective mining units.<br>Any assumptions about correlation between variables.<br>Description of how the geological interpretation was used to control the resource estimates.<br>Discussion of basis for using or not using grade cutting or capping.<br>The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available. | Gold grade was estimated using Leapfrog EDGE and was completed using ordinary kriging. It was considered that a more robust geological model with smoother and more continuous mineralised lodes will reduce the effects of higher CV.<br>Estimation was carried out on the parent cell.<br>Variograms were generated for the main lodes of each zone of mineralisation, with variogram parameters assigned to similar domains.<br>Search ellipse dimensions and orientation reflect the parameters derived from the variography and geological analysis.<br>Only Au grade was estimated. No other elements were estimated. No deleterious elements were estimated at this point with variable copper known within the system.<br>Block sizes were selected based on drill spacing and the thickness of the mineralised veins with sub blocking utilised to honour estimation domain volumes and are 10m (east) by 15m (north) by 5m (z) with sub blocking down to 1m/1.5m/1m.<br>Average drill spacing ranges from 25m x 25m in directly under the mined pits, down to 75m x 75m at mineralisation depths and extents.<br>No selective mining units were assumed in the resource estimate.<br>Blocks were generated within the mineralised volumes that defined each mineralised zone. Blocks within these zones were estimated using data that was contained with the same zone.<br>Hard boundaries were used for all domains.<br>Top cuts were applied to the data to control the effects of extreme high-grade Au values that were considered not representative. The effect of the top cuts was reviewed with respect to the resulting Population distribution and fragmentation, mean and CV values.<br>The model was validated by comparing statistics of the estimated blocks against the composited sample data; visual examination of the block grades versus assay data in section; swathe plots; and reconciliation against previous production and estimates. |
| <b>Moisture</b>                                                                                                                                       | Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All estimations are carried out on a 'dry' basis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                                                                                                                                                       | eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Metallurgical factors or assumptions</b>                                                                                                           | The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.                                                                                                                                                       | It is assumed the material will be trucked and processed at Black Cat's Lakewood mill. Recovery factors are assigned based on lab test work, and on-going experience. No metallurgical assumptions have been built or applied to the Resource model.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Environmental factors or assumptions</b>                                                                                                           | Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made. | A conventional storage facility is used for the process plant tailings. Waste rock is to be stored in a traditional waste rock landform 'waste dump'. There is no evidence from previous mining to indicate the presence of deleterious elements within the Imperial or Majestic waste rock.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Bulk density</b>                                                                                                                                   | Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples. The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit. Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.                                                                                                                       | Bulk density is assigned based on regolith. Values of 1.80, 2.45 and 2.70 t/m <sup>3</sup> are used for oxide, transitional and fresh waste rock respectively. Bulk density values were taken from historic test work and correlate well with results from other areas in the region with similar geology. Density values are allocated uniformly to each regolith type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Classification</b>                                                                                                                                 | The basis for the classification of the Mineral Resources into varying confidence categories.<br>Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).<br>Whether the result appropriately reflects the Competent Person's view of the deposit.                                                                                                                                                                                                                         | There is no Measured Mineral Resources at Imperial.<br><br>Indicated mineralisation classification has been applied to those parts of each lode where the drill intercept spacing approximates 25m x 25m and has robust geological and mineralogical understanding and continuity. It has also generally been estimated on the first or second interpolation pass.<br><br>Inferred mineral resources are based on limited data support. No development for geological mapping; typically drill spacing greater than 25m x 25m (down to 75m x 50m at resource extents).<br><br>Further considerations of resource classification include; Data type and quality (drilling type, drilling orientations, down hole surveys, sampling and assaying methods); Geological mapping and understanding; statistical performance including number of samples, slope regression and kriging efficiency.<br><br>The classification of the Mineral Resource estimate appropriately reflects the view of the Competent Person. |
| <b>Audits or reviews</b>                                                                                                                              | The results of any audits or reviews of Mineral Resource estimates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | The geological interpretation, estimation parameters and validation of the Resource model were peer reviewed by Black Cat staff prior to accepting the responsibility for the Mineral Resource. No external reviews of the Resource estimate had been carried out at the time of writing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Discussion of relative accuracy/ confidence</b>                                                                                                    | <p>Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.</p> <p>The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.</p> <p>These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.</p> | <p>The relative accuracy of the Mineral Resource estimate is reflected in the reporting of the Mineral Resource as per the guidelines of the 2012 JORC Code.</p> <p>The statement relates to the global estimates of tonnes and grade constrained within an optimised pit shell using a gold price of AU\$6,000 and a 0.35g/t Au cut-off for open pit, and 1.8g/t Au below the pit for underground.</p> <p>The Mineral Resource was compared to the previous estimate, with similar results in areas of similar interpretation. Variations and increases in the Mineral Resource have resulted from extensional drilling and minor reinterpretation.</p> |

| Section 4: Estimation and Reporting of Ore Reserves             |                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Study status</b>                                             | <p>The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.</p> <p>The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.</p> | <p>The level of study is to Pre-Feasibility Study accuracy.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Cut-off parameters</b>                                       | <p>The basis of the cut-off grade(s) or quality parameters applied.</p>                                                                                                                                                                                                                                                                                                                                                                                   | <p>Breakeven cut-off grades were calculated using planned mining costs. The breakeven cut-off included mining costs, surface haulage, processing, and administration costs.</p> <p>A Reserve cut-off grade of 0.4g/t has been used for open pit estimations.</p>                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Mining factors or assumptions</b>                            | <p>The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).</p> <p>The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.</p>                  | <p>Open pit optimisations were conducted using Datamine's Maxipit software. The optimal pit shell was selected based on NPV (with a zero % discount rate) and total volume. The optimal shell was used as the basis of a detailed pit design that would suit the selected mining equipment and proposed site layout</p> <p>Open pit mining assumed a top down drill and blast and load and haul method on 5m benches, mined over two flitches. Drill and blast requirements assumed 50% blasting in oxide rock and 100% blasting in transitional and fresh rock. Associated design issues such as pre-strip, access, etc were considered in designing the mine</p> |

## Annual Mineral Resource and Ore Reserve Statement

| Section 4: Estimation and Reporting of Ore Reserves |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                                                     | <p>The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc.), grade control and pre-production drilling.</p> <p>The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).</p> <p>The mining dilution factors used.</p> <p>The mining recovery factors used. Any minimum mining widths used.</p> <p>The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.</p> <p>The infrastructure requirements of the selected mining methods.</p>                                                                                                                                                                                                           | <p>Geotechnical assessments of the rock mass were conducted and pit design parameters were recommended by an external consultant.</p> <p>Required grade control requirements were estimated.</p> <p>The Imperial June 2026 Mineral Resource Model was used for the open pit assessment.</p> <p>Mining dilution was applied to the Resource Model using Datamine's Mineable Shape Optimiser (MSO). The main assumptions used to determine the minable open pit shapes include; a minimum ore width of 1.25m wide, 0.625m dilution on footwall, 0.625m dilution on the hangingwall, shape length of 5m and height of 5m.</p> <p>An open pit mining recovery factor of 90% was applied to account for unplanned ore loss. Minimum ore mining width equals 2.5m (1.25m ore, 1.25m dilution), minimum working width is ~20m.</p> <p>No Inferred Mineral Resource is considered in the mining study. Inferred Mineral Resource was assigned a grade of 0.01g/t before pit open pit optimisations or mining dilution was considered.</p> <p>A site layout was designed as part of the mining study. The site layout considers the location, size and design criteria for waste dumps. The site layout also considers abandonment bund location, communication requirements, explosives storage, office requirements, ore storage facilities, roads, surface water, workshops, etc.</p> |
| <b>Metallurgical factors or assumptions</b>         | <p>The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.</p> <p>Whether the metallurgical process is well-tested technology or novel in nature.</p> <p>The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domain applied and the corresponding metallurgical recovery factors applied.</p> <p>Any assumptions or allowances made for deleterious elements.</p> <p>The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the ore body as a whole.</p> <p>For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?</p> | <p>The metallurgical process proposed is two stage crushing and milling to 106µm with gravity recovery and carbon in leach extraction at Black Cat's Lakewood Gold Processing Facility.</p> <p>The metallurgical process is well tested and commonly used in similar operations worldwide.</p> <p>The Ore Reserve estimation was based on recoveries established during a multitude of test programmes carried out between 2011 and 2015 and verified by mining an initial pit between 2016 and 2018.</p> <p>The Ore Reserve estimation has been based on the recoveries and processes outlined above which are well tested and established as being appropriate for similar metallurgical specifications.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Environmental</b>                                | <p>The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterization and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Various Environmental Studies have been completed using various independent specialist consultants, as part of the Environmental Effects Statement process. Existing approvals are in place for mining Imperial however approvals require updating for the mining method and for the total footprint of the project.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Audits or reviews</b>                            | The results of any audits or reviews of Ore Reserve estimates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | The Ore Reserve has undergone internal peer review.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Discussion of relative accuracy/ confidence</b>  | <p>Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.</p> <p>The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.</p> <p>Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.</p> <p>It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.</p> | <p>The mine designs, schedule and financial model for the Ore Reserve have been completed to a Pre-Feasibility standard with level of confidence equal to or better than +/-25% level of confidence</p> <p>Metallurgical recoveries have been based on metallurgical test work from the Imperial deposit using site water at the nominated grind size, with recoveries verified by historic mining.</p> <p>Costs have been estimated by the Competent Person from budget quotations, factored estimates, or cost data from similar operations/ projects.</p> <p>A degree of uncertainty is associated with geological estimates and the Ore Reserve classification reflects the level of confidence in the Mineral Resource.</p> <p>There is a degree of uncertainty regarding estimates of modifying mining factors, geotechnical and processing parameters and the Ore Reserve classification reflects the level of confidence of the study.</p> <p>The Competent Person is satisfied that the current gold price is sufficient that the Ore Reserve estimate would remain economically viable with foreseeable negative impacts applied to these factors or parameters.</p> <p>There is a degree of uncertainty in the commodity price used however the Competent Person is satisfied that the assumptions used to determine the economic viability of the Ore Reserve is based on reasonable current data</p> <p>Sensitivity studies demonstrate standard linear deviations. The project is most susceptible to fluctuations in gold price.</p> |

| Criteria                                | JORC Code Explanation                                                                                                                                                                                                                                                                                                        | Commentary                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Sampling techniques</b>              | Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. | Drilling has been completed by numerous parties over the life of the project. RAB and reverse circulation have been completed. Black Cat has completed 14,053 m of RC drilling and 100m of diamond drilling to test and infill historic and existing drilling and extend the mineralisation.                                                                                                                            |
|                                         | Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.                                                                                                                                                                                | Drilling undertaken by Black Cat provides high quality representative samples that are carried out to industry standard and include QAQC standards. All samples are weighed in the laboratory. There are few details for drilling by previous operators, and protocols and procedures are assumed to be in line with industry standard at the time of drilling. Historic results are in line with Black Cat's drilling. |

## Annual Mineral Resource and Ore Reserve Statement

|                                                       | Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1m samples from which 3kg was pulverised to produce a 30g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems.<br>Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information. | Black Cat's reverse circulation drilling was sampled into 1m intervals via a cone splitter on the rig producing a representative sample of approximately 3kg. Samples were selected to weigh less than 3kg to ensure total sample inclusion at the pulverisation stage. All samples were crushed, dried and pulverised to a nominal 90% passing 75µm to produce a 40g or 50g sub sample for analysis by FA/AAS.<br>Drilling by Fairstar Resources was by RC percussion. Sampling was conducted at 1 metre intervals.<br>For drilling by Titan Resources, a face sampling hammer was utilised. Drill samples were collected in plastic bags, via a cyclone as individual meters. Samples, 1m and composites, were split with a 75:25 riffle splitter.<br>Drilling by Bedrock Mining used an RC hammer from surface to base of oxidation. Slow penetration rates generally necessitated the use of a conventional hammer bit at greater depth. Samples were collected at one metre intervals into plastic bags via a cyclone and composited to 2 metre splits for analysis. Analytical samples were collected by tube sampling, except in intervals with strongly heterogeneous particle size, such as quartz stockwork veins within clay, which were riffle split. |
| <b>Drilling techniques</b>                            | Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).                                                                                                                                                                                                                                                                                 | Black Cat's and Titan Resources RC drilling was completed using a face sampling percussion hammer.<br>Bedrock Mining's RC drilling used a conventional RC hammer.<br>Fairstar's RC drilling details are unknown.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Drill sample recovery</b>                          | Method of recording and assessing core and chip sample recoveries and results assessed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Black Cat's RC drilling had recovery and sample dampness recorded as routine. There were no issues.<br>There are no record or comment of sample recovery from previous operators drilling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

These chip/core trays are archived in Kalgoorlie. No historic core or chips are available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|                                                       | The total length and percentage of the relevant intersections logged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All drilling by Black Cat has been logged in full.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Sub-sampling techniques and sample preparation</b> | If core, whether cut or sawn and whether quarter, half or all core taken.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | A single diamond hole has been drilled. Diamond core is sawn half core using a diamond-blade saw, with the same half of the core consistently taken for analysis. The un-sampled half of diamond core is retained for check sampling if required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                                                       | If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | All Black Cat's RC sampling has been cone split to 1m increments on the rig. Most of the sampling has been dry. Where wet samples have been encountered, the hole is conditioned and splitter cleaned to prevent downhole contamination. The sampling was generally dry as per Black Cat's logging.<br>There is no comment on sampling method by Fairstar Resources, but it is assumed to be rig-mounted cone splitter.<br>Titan Resources collected samples using a 75:25 riffle splitter.<br>Bedrock Mining collected samples by tube sampling, except in intervals with strongly heterogeneous particle size, such as quartz stockwork veins within clay, which were riffle split.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                                                       | For all sample types, the nature, quality and appropriateness of the sample preparation technique.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Black Cat's sample preparation adheres to industry best practice. It is conducted by a commercial laboratory and involves oven drying, coarse crushing then total grinding to a size of 90% passing 75µm. Historic preparation of samples is unknown but assumed as industry standard.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                                                       | Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All subsampling activities are carried out by commercial laboratory and are considered satisfactory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|                                                       | Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second half sampling.                                                                                                                                                                                                                                                                                                                                                                                              | Black Cat's reverse circulation field duplicate samples are carried out at a rate of 1:50 and are sampled directly from the on-board splitter on the rig. These are submitted for the same assay process as the original samples and the laboratory are unaware of such submissions.<br>No details of duplicate sampling methods were detailed by previous operators.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|                                                       | Whether sample sizes are appropriate to the grain size of the material being sampled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Black Cat sample sizes of 3kg are considered appropriate given the grain size (90% passing 75µm) of the material sampled. Details for previous operators drilling are unknown but assumed to be in line with industry standards at the time of drilling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Annual Mineral Resource and Ore Reserve Statement

| Section 1: Sampling Techniques and Data                 |                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                                                         | Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.                                                                                                       | Black Cat's Logging is completed in the field on a tablet before being uploaded into an SQL database. Assay files are uploaded directly from the lab into the database. The database is managed by a third party. Previous operators' data has been reviewed from the digital file to the hard copies of annual reports with limited errors observed.                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                                                         | Discuss any adjustment to assay data.                                                                                                                                                                                            | No adjustments have been made to the assay data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Location of data points                                 | Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.                                                      | Black Cat's drilling is marked out using a handheld GPS prior to drilling. Once complete, the hole collars are picked up by an external contractor using RTK GPS. Downhole surveys are conducted by the drilling contractor at the end of each hole using a down hole north seeking gyro.<br>Survey control for previous operator's drilling is not discussed in the annual reports and represents a risk to the Mineral Resource which is reflected in the classification. Black Cat has surveyed previous operators drill hole collars where they were located in the field.                                                                                                                                                                                                  |
|                                                         | Specification of the grid system used.                                                                                                                                                                                           | Drilling completed prior to 2000 (i.e. Titan Resources and Bedrock Mining) operated on local grid for the Jones Find area that has been converted to MGA 94 Zone 51 for estimation. All reported references are in MGA 94 Zone 51.<br>Post-2000 drilling (Black Cat and Fairstar Resources) uses the grid system GDA 1994 MGA Zone 51.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                                         | Quality and adequacy of topographic control.                                                                                                                                                                                     | The topographic surface was compiled using the RTK GPS collar surveys and is considered sufficiently accurate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Data spacing and distribution                           | Data spacing for reporting of Exploration Results.                                                                                                                                                                               | The nominal drill hole spacing is 25m x 25m in the north and 50m by 50m in the south.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                                                         | Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.     | It is sufficient.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Orientation of data in relation to geological structure | Whether sample compositing has been applied.                                                                                                                                                                                     | Drill hole data has been composited downhole to 1m prior to the geostatistical analysis, continuity modelling and grade estimation process. The compositing has been run within the respective mineralisation domains using these as hard boundaries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                                                         | Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.                                                                       | Drilling is angled towards the east at -60 to intersect the mineralised zones. These orientations are acceptable given the moderately dipping nature of the mineralisation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|                                                         | If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.                       | All drilling from surface has been drilled as close to perpendicular to the predicted orientation of mineralisation as possible. This has reduced the risk of introducing a sampling bias as far as possible. No orientation-based sampling bias has been identified in the data at this point.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Sample security                                         | The measures taken to ensure sample security.                                                                                                                                                                                    | Black Cat's samples prepared on site by Black Cat geological staff. Samples are selected, collected into tied calico                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Annual Mineral Resource and Ore Reserve Statement

| Exploration done by other parties           | Acknowledgment and appraisal of exploration by other parties.                                                                                                                                                                                                                | Gold in the prospect was first discovered during the 1930s during the construction of a north-south fence in the tenement by Jones family of Hampton Hill Station. The Jones Find deposit was initially worked by the Jones family and is reported to have mined rich ore; however, no records are available. Other prospectors tried their luck and sunk a number of shafts with unknown results. In the 1970's, a number of costeans were excavated by prospectors and Western Mining Corporation (WMC Resources). In 1982 the area was pegged by Mr NR McAllister, and a series of vacuum holes were drilled.<br>Between the early 1980's and acquisition by Black Cat in 2020, exploration over the Jones Find area was carried out by several companies (Endeavour Resources NL, Gindalbie Gold NL, Indian Ocean Resources Ltd, Mr. McAllister NL, Newmex Exploration Ltd, Bedrock Mining PL, Croesus Mining NL, Titan Resources NL, Fairstar Resources Ltd, Integra Mining Ltd). Significant RAB drilling programmes were completed by Indian Ocean Resources Ltd in 1988 and Croesus Mining NL in 1995. RC programmes were completed by Bedrock Mining in 1989, Titan Resources in 1995; and Fairstar Resources in 2007. Integra drilled a series of RAB holes around the periphery of the tenement in 2011.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Geology                                     | Deposit type, geological setting and style of mineralisation.                                                                                                                                                                                                                | The style of mineralisation is Archaean orogenic gold.<br>Jones Find is characterised by low topographical relief covered in recent alluvium. Based on historic mine dumps, mapped workings, and diamond drilling, the tenement is considered to contain a primarily north-striking and steeply west dipping sequence of sheared mafic-intermediate intrusive rock. The host is locally foliated and schistose, particularly in proximity to historical workings. Widespread alteration comprises silica-carbonate, whilst localised zones of silica-sericite-kaolinite are observed as well as silica-sericite-chlorite(-biotite). The weathering in the area is typically to depths of 20-35m and displays evidence of supergene enrichment.<br>The mineralisation remains open in all directions.<br>Structurally, the tenement is located on the eastern flank of the south plunging Bulong anticline. The western margin of the granite to granodiorite phase pluton coincides with a major northwest striking shear (Majestic shear/fault). The Jones Find Prospect is inferred to lie on a subsidiary splay of this major shear zone.<br>Locally, the granitoid exhibits intense shear related deformation, which is associated with alteration haloes of up to 100 m in width. The following four styles of gold mineralisation have been recognised in the tenement:<br>1. Narrow, gold containing quartz vein zones associated with shearing and biotite/sericite alteration. Most old mine workings are developed in these zones.<br>2. Quartz-biotite-clay ± albite alteration associated with anomalous gold assays ranging from 0.1g/t gold to 0.4g/t gold.<br>3. Supergene gold mineralisation within the saprolitic zone. |

## Annual Mineral Resource and Ore Reserve Statement

| Section 2: Reporting of Exploration Results                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                      |

| Criteria                                                                | JORC Code Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Commentary                                                                                                                                                                                                                           |
| <b>Drill hole information</b>                                           | <p>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</p> <ul style="list-style-type: none"> <li>– easting and northing of the drill hole collar;</li> <li>– elevation or Reduced Level ("RL") (elevation above sea level in metres) of the drill hole collar;</li> <li>– dip and azimuth of the hole;</li> <li>– down hole length and interception depth;</li> <li>– hole length; and</li> <li>– if the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li> </ul> | <p>All the drill hole data was used directly or indirectly for the preparation of the resource estimates in the resource report. Exclusion of the drill information will not detract from the understanding of the report.</p>       |
| <b>Data aggregation methods</b>                                         | In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high grades) and cut-off grades are usually Material and should be stated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | No exploration results reported within this announcement                                                                                                                                                                             |
|                                                                         | Where aggregate intercepts incorporate short lengths of high grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | No exploration results reported within this announcement                                                                                                                                                                             |
|                                                                         | The assumptions used for any reporting of metal equivalent values should be clearly stated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Not applicable, as no metal equivalent values have been reported.                                                                                                                                                                    |
| <b>Relationship between mineralisation widths and intercept lengths</b> | <p>These relationships are particularly important in the reporting of Exploration Results.</p> <p>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</p> <p>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</p>                                                                                                                                                                                                                                                                                                                                                                                | No exploration results reported within this announcement                                                                                                                                                                             |
| <b>Diagrams</b>                                                         | Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to, a plan view of drill hole collar locations and appropriate sectional views.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Appropriate diagrams were released at time of Resource announcement. Refer to the relevant Resource Announcement listed in Notes on Resources under Gold Resource Table of this announcement.                                        |
| <b>Balanced reporting</b>                                               | Where comprehensive reporting of all Exploration Results are not practicable, representative reporting of both low and high grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | No exploration results reported within this announcement                                                                                                                                                                             |
| <b>Other substantive exploration data</b>                               | Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.                                                                                                                                                                                                                                                                                                                                                                                             | Geophysical surveys including aeromagnetic surveys have been carried out by previous owners to highlight and interpret prospective structures in the project area. No geophysics was used in the production of the Mineral Resource. |
| <b>Further work</b>                                                     | <p>The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).</p> <p>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</p>                                                                                                                                                                                                                                                                                                                                                                                                                            | Black Cat plans to continue exploration and infill drilling in the area to upgrade the current resource and the associated geological interpretation.                                                                                |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in Section 1, and where relevant in Section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Drilling was observed at the time.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Geological interpretation</b>                                                                                                                      | Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.<br>Nature of the data used and of any assumptions made.<br>The effect, if any, of alternative interpretations on Mineral Resource estimation.<br>The use of geology in guiding and controlling Mineral Resource estimation.<br>The factors affecting continuity both of grade and geology.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | The resource categories assigned to the model directly reflect the confidence of the geological interpretation, that was constructed based primarily on trends in the grade data.<br>Wireframes of the mineralisation were constructed using cross sectional interpretations based on a 0.4g/t Au cut-off grade with no minimum downhole length. Some holes with <0.4g/t Au were included to ensure consistent geological continuity. Internal high-grade subdomains were interpreted at approximate 1.1g/t cut off grade.<br>The geological interpretation has considered all available geological information. RC and Diamond drilling was used during interpretation. RAB and AC were excluded due to the lack of confidence in the technique for modelling and estimation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Dimensions</b>                                                                                                                                     | The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | The mineralisation extends over a strike length of 1,400m, is 370m across, and extends 200m down dip. It is open at depth, along strike to the south-west, down-plunge to the north-west.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Estimation and modelling techniques</b>                                                                                                            | The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.<br>The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.<br>The assumptions made regarding recovery of by-products.<br>Estimation of deleterious elements or other non-grade variables of economic significance (e.g. sulphur for acid mine drainage characterisation).<br>In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.<br>Any assumptions behind modelling of selective mining units.<br>Any assumptions about correlation between variables.<br>Description of how the geological interpretation was used to control the resource estimates.<br>Discussion of basis for using or not using grade cutting or capping.<br>The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available. | Gold grade was estimated using Leapfrog EDGE and was completed using ordinary kriging (with ID2 in a couple of small domains). It was considered that a more robust geological model with smoother and more continuous mineralised lodes will reduce the effects of higher CV. Estimation was carried out on the parent cell with 5x5x5 discretisation points.<br>Variograms were generated for the main lodes, with variogram parameters assigned to similar domains.<br>Search ellipse dimensions and orientation reflect the parameters derived from the variography and geological analysis.<br>Only Au grade was estimated. No other elements were estimated.<br><br>No deleterious elements were estimated or assumed.<br><br>Block sizes were selected based on drill spacing and the thickness of the mineralised veins at 10m (east) by 10m (north) by 5m (z). Sub blocking down to 0.625m in all directions to honour estimation domain volumes.<br>Average drill spacing was 40-25m x 25m.<br>No selective mining units were assumed in the resource estimate.<br>Blocks were generated within the mineralised volumes that defined each mineralised zone. Blocks within these zones were estimated using data that was contained with the same zone. Hard boundaries were used for all domains.<br>Top cuts were applied to the data to control the effects of extreme high-grade Au values that were considered not representative. The effect of the top cuts was reviewed with respect to the resulting Population distribution and fragmentation, mean and CV values.<br>The model was validated by comparing statistics of the estimated blocks against the composited sample data; visual examination of the block grades versus assay data in section. |
| <b>Moisture</b>                                                                                                                                       | Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | All tonnages are reported on a 'dry' basis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in Section 1, and where relevant in Section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Cut-off parameters</b>                                                                                                                             | The basis of the adopted cut-off grade(s) or quality parameters applied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | The indicative cut-off grade of 0.7g/t Au for the Mineral Resource estimation is determined by the assumption that mining will be a small-sized open pit operation to approximately 65m below surface. This has been calculated from first principals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Mining factors or assumptions</b>                                                                                                                  | Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.                                                                                                                           | No minimum width is applied to the Resource. Minimum widths are assessed and applied using Whittle or Mining Shape Optimiser software during the Reserve process.<br>It is assumed that planned dilution is factored into the process at the stage of Reserve and stope design planning.<br>The open pit depth is applied to all material above the base of the \$AUD2,500 pit shell optimised with current industry rates.                                                                                                                                                                                                                                                                                                                                                  |
| <b>Metallurgical factors or assumptions</b>                                                                                                           | The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.                                                                                                                                                       | Assumed the material will be trucked and processed at Black Cat's own mill.<br>No metallurgical assumptions have been built or applied to the Resource model.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Environmental factors or assumptions</b>                                                                                                           | Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made. | A conventional storage facility is used for the process plant tailings.<br>Waste rock is to be stored in a traditional waste rock landform 'waste dump'. There is no evidence to indicate the presence of deleterious elements within the deposit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Bulk density</b>                                                                                                                                   | Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.<br>The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.<br>Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.                                                                                                                 | Bulk density is assigned based on regolith. Values of 1.80, 2.45 and 2.70 t/m <sup>3</sup> are used for oxide, transitional and fresh rock respectively.<br><br>Bulk density values were taken from the adjacent Imperial/Majestic deposit which were based on historic test work and correlate well with results from other areas in the region with similar geology. Density values were measured in fresh rock from diamond core drilled at the deposit. These had an acceptable correlation with the values used. Further work on density will be completed as the project progresses.<br>Density values are allocated uniformly to each regolith type.                                                                                                                  |
| <b>Classification</b>                                                                                                                                 | The basis for the classification of the Mineral Resources into varying confidence categories.<br>Whether appropriate account has been taken of all relevant factors (i.e. relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).<br>Whether the result appropriately reflects the Competent Person's view of the deposit.                                                                                                                                                                                                                       | There are no Measured Mineral Resources.<br>Indicated resources are based around close spaced drilling data down to 25 m x 25m.<br>Inferred mineral resources are based on limited data support. No development for geological mapping; typically drill spacing greater than 25m x 25m (down to 50m x 50m at classified Resource extents).<br>Further considerations of Resource classification include: Data type and quality (drilling type, drilling orientations, down hole surveys, sampling and assaying methods); Geological mapping and understanding; Statistical performance including number of samples, Slope regression and Kriging efficiency.<br>The classification of the Mineral Resource estimate appropriately reflects the view of the Competent Person. |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in Section 1, and where relevant in Section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Criteria                                                                                                                                              | JORC Code Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Audits or reviews</b>                                                                                                                              | The results of any audits or reviews of Mineral Resource estimates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | The geological interpretation, estimation parameters and validation of the Resource model were peer reviewed by Black Cat staff prior to accepting the responsibility for the Mineral Resource.<br>No external reviews of the Resource estimate had been carried out at the time of writing.                                                                                                                                                                                              |
| <b>Discussion of relative accuracy/ confidence</b>                                                                                                    | Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.<br><br>The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.<br><br>These statements of relative accuracy and confidence of the estimate should be compared with production data, where available. | The relative accuracy of the Mineral Resource estimate is reflected in the reporting of the Mineral Resource as per the guidelines of the 2012 JORC Code. The estimated uncertainty for $\pm 10\%$ Measured Mineral Resources; $\pm 20\%$ for Indicated Mineral Resources and $\pm 30\%$ for Inferred Mineral Resources.<br><br>The statement relates to the global estimates of tonnes and grade above an RL selected from the base of an optimisation pit shell at a 0.7g/t Au cut-off. |

| Section 4: Estimation and Reporting of Ore Reserves             |                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                   |

| <b>Mineral Resource estimate for conversion to Ore Reserves</b> | Description of the Mineral Resource estimate used as a basis for the conversion to an Ore Reserve.<br>Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.                                                                                                                                                                                                                       | The Mineral Resource Estimate used is classified a JORC 2012 Mineral Resource statement as per Black Cat Syndicate's, March 2022 Jones Find - Mineral Resource estimate.<br><br>The Mineral Resources are reported inclusive of the Ore Reserves and are as stated in Jones Find Mineral Resource statement.      |
| <b>Site visits</b>                                              | Comment on any site visits undertaken by the Competent Person and the outcome of those visits.<br>If no site visits have been undertaken indicate why this is the case.                                                                                                                                                                                                                                                                        | Site visits were undertaken by the Competent Person for Ore Reserve assessment.                                                                                                                                                                                                                                   |
| <b>Study status</b>                                             | The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.<br>The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered. | The level of study is to Preliminary Feasibility Study accuracy.                                                                                                                                                                                                                                                  |
| <b>Cut-off parameters</b>                                       | The basis of the cut-off grade(s) or quality parameters applied.                                                                                                                                                                                                                                                                                                                                                                               | Breakeven cut-off grades were calculated using planned mining costs.<br><br>A Reserve cut-off grade of 0.3g/t has been used for open pit estimations. The breakeven cut-off included mining costs, surface haulage, processing, and administration costs.                                                         |
| <b>Mining factors or assumptions</b>                            | The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).                                                                                                                                                                                            | Open pit optimisations were conducted using Datamine's Maxipit software. The optimal pit shell was selected based on NPV (with a zero % discount rate) and total volume. The optimal shell was used as the basis of a detailed pit design that would suit the selected mining equipment and proposed site layout. |

## Annual Mineral Resource and Ore Reserve Statement

| Section 4: Estimation and Reporting of Ore Reserves |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

|                                                     | <p>The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.</p> <p>The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc.), grade control and pre-production drilling.</p> <p>The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).</p> <p>The mining dilution factors used.</p> <p>The mining recovery factors used. Any minimum mining widths used.</p> <p>The manner in which Inferred Mineral Resources are utilised in mining studies and the sensitivity of the outcome to their inclusion.</p> <p>The infrastructure requirements of the selected mining methods.</p>                                | <p>Open pit mining assumed a top down drill and blast and load and haul method on 5m benches, mined over two flitches. Drill and blast requirements assumed 50% blasting in oxide rock and 100% blasting in transitional and fresh rock. Associated design issues such as pre-strip, access, etc were considered in designing the mine.</p> <p>Preliminary geotechnical assessments of the rock mass were conducted based on core photos and knowledge of the area. Pit design parameters were recommended by an external consultant.</p> <p>Required grade control requirements were estimated.</p> <p>The Jones Find March 2022 Mineral Resource Model was used for the open pit assessment.</p> <p>Mining dilution was applied to the Resource Model using Datamine's Mineable Shape Optimiser (MSO). The main assumptions used to determine the minable open pit shapes include; a minimum ore width of 1.25m wide, 0.65m dilution on footwall, 0.65m dilution on the hangingwall, stope length of 5m, and a stope height of 5m.</p> <p>An open pit mining recovery factor of 95% was applied to account for unplanned ore loss. Minimum ore mining width equals 2.5m (1.25m ore, 1.25m dilution), minimum working width is ~20m.</p> <p>No Inferred Mineral Resource is considered in the mining study. Inferred Mineral Resource was assigned a grade of 0.01g/t before pit open pit optimisations or mining dilution was considered.</p> <p>A site layout was designed as part of the mining study. The site layout considers the location, size and design criteria for waste dumps. The site layout also considers abandonment bund location, communication requirements, explosives storage, office requirements, ore storage facilities, roads, surface water, workshops, etc.</p> |
| <b>Metallurgical factors or assumptions</b>         | <p>The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.</p> <p>Whether the metallurgical process is well-tested technology or novel in nature.</p> <p>The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.</p> <p>Any assumptions or allowances made for deleterious elements.</p> <p>The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the ore body as a whole.</p> <p>For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?</p> | <p>The metallurgical process proposed is two stage crushing and milling to 106µm with gravity recovery and carbon in leach extraction at Black Cat's Lakewood Gold Processing Facility.</p> <p>The metallurgical process is well tested and commonly used in similar operations worldwide.</p> <p>The Ore Reserve estimation was based on recoveries established during test programs carried out in 2021-2022.</p> <p>The Ore Reserve estimation has been based on the recoveries and processes outlined above which are well tested and established as being appropriate for similar metallurgical specifications.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Highlight and discuss the materiality of any unresolved matter that is dependent on a third party on which extraction of the reserve is contingent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Classification</b>                               | <p>The basis for the classification of the Ore Reserves into varying confidence categories.</p> <p>Whether the result appropriately reflects the Competent Person's view of the deposit.</p> <p>The proportion of Probable Ore Reserves that have been derived from Measured Mineral Resources (if any).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <p>Mineral Resources converted to Ore Reserves as per JORC 2012 guidelines, i.e. Measured to Proved, Indicated to Probable. No downgrading in category has occurred for this project.</p> <p>The result reflects the Competent Person's view of the deposit.</p> <p>No Probable Ore Reserves are derived from Measured Mineral Resources at this date.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Audits or reviews</b>                            | The results of any audits or reviews of Ore Reserve estimates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | The Ore Reserve has undergone internal peer review.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Discussion of relative accuracy/ confidence</b>  | <p>Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.</p> <p>The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.</p> <p>Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.</p> <p>It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.</p> | <p>The mine designs, schedule and financial model for the Ore Reserve have been completed to a Pre-Feasibility standard with level of confidence equal to or better than +/-25% level of confidence</p> <p>Metallurgical recoveries have been based on metallurgical test work from the Jones Find deposit using site water at the nominated grind size, with recoveries verified by historic mining.</p> <p>Costs have been estimated by the Competent Person from budget quotations, factored estimates, or cost data from similar operations/ projects.</p> <p>A degree of uncertainty is associated with geological estimates and the Ore Reserve classification reflects the level of confidence in the Mineral Resource.</p> <p>There is a degree of uncertainty regarding estimates of modifying mining factors, geotechnical and processing parameters and the Ore Reserve classification reflects the level of confidence of the study.</p> <p>The Competent Person is satisfied that the current gold price is sufficient that the Ore Reserve estimate would remain economically viable with any negative impacts applied to these factors or parameters.</p> <p>There is a degree of uncertainty in the commodity price used however the Competent Person is satisfied that the assumptions used to determine the economic viability of the Ore Reserve is based on reasonable current data</p> <p>Sensitivity studies demonstrate standard linear deviations. The project is most susceptible to fluctuations in gold price.</p> |

## MAJESTIC

| <b>Sampling techniques</b>              | Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. | <p>The sampling database for the Majestic area has been compiled from information collected by several different companies since initial discovery in the late 1960's and early 1970's. All information collected prior to involvement by Black Cat syndicate in 2020. Only historical data that is deemed as having acceptable location and assay information has been included in the Mineral Resource estimation dataset.</p> <p>Previous drilling has been completed by Integra and Silver Lake Resources. Air core, RAB, reverse circulation, and diamond drilling have all been completed.</p> |

## Annual Mineral Resource and Ore Reserve Statement

| Section 1: Sampling Techniques and Data |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| Criteria                                | JORC Code Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                                         | <p>Black Cat has completed a program of reverse circulation (RC) and diamond drilling (DD) to test historic drilling and extend the mineralisation. Recent 2026 DD has been completed from underground development platforms at 15m x 15m spacing.</p> <p>Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.</p> <p>For Black Cat DD samples, metre delineation is recorded by the drillers on core blocks. This is checked and compared to the measurements of the core by the geologist during core mark-up prior to logging to prevent incorrect logging and sampling errors. Sample intervals are then marked on the core by a geologist, to honour geological boundaries.</p> <p>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1m samples from which 3kg was pulverised to produce a 30g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information.</p> <p>For Integra and Silver Lake:<br/>Drill cuttings were extracted from the RC return via cyclone. The underflow from each 1 m interval was transferred via bucket to a 75/12.5/12.5% riffle splitter, delivering approximately three kilograms of the recovered material into calico bags for analysis. 1m samples were collected throughout the entire drill hole. 3m composites samples were collected with a spear, in low priority areas, and these samples were submitted for analysis. Any composite assays returning anomalous intersections were resampled using the 1m sample collected during drilling.<br/>All NQ2 diamond holes were half-core sampled over prospective mineralised intervals determined by the geologist. Within fresh rock, core was oriented for structural/geotechnical logging wherever possible. In oriented core, one half of the core was sampled over intervals ranging from 0.3m to 1.2m and submitted for fire assay analysis for gold. The remaining core, including the bottom of-hole orientation line, was retained for geological reference and potential further sampling such as metallurgical test work. In intervals of un-oriented core, the same half of the core has been sampled where possible, by extending a cut line from oriented intervals through into the un-oriented intervals. The lack of a consistent geological reference plane, (such as bedding or a foliation), precludes using geological features to orient the core. Diamond holes were surveyed during drilling with down hole single shot cameras, and the majority of drill holes were resurveyed at the completion of the drill hole using a collar orientated Gyro Inclinator at 10m intervals.</p> <p>For Black Cat 2020-2021:<br/>Reverse circulation drilling is sampled into 1m intervals via a cone splitter on the rig producing a representative sample of approximately 2-3kg. Samples are selected to weigh less than 3kg to ensure total sample inclusion at the pulverisation stage. All samples are crushed, dried and pulverised to a nominal 90% passing 75µm to produce a 40g or 50g sub sample for analysis by FA/AAS.<br/>All NQ2 diamond holes are half core sampled over the entire length of the hole to geological contacts. Sample lengths range from 0.2-1.2m, with the same half consistently taken where possible to reduce any human bias in sampling. Core is orientated where possible for structural and geotechnical logging.<br/>All holes are surveyed by downhole north-seeking gyro, and collars are picked up by RTK GPS by a chartered survey contractor.</p> <p>For Black Cat 2026:<br/>All NQ2 DD are whole core sampled, with sample intervals ranging from 0.3m to 1.2m. Core is orientated where possible for structural and geotechnical logging.<br/>All holes are surveyed by downhole north-seeking gyro, and collars are picked up by RTK GPS by a chartered survey contractor.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Drilling techniques</b>              | Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>All RC drilling was completed using a face sampling percussion hammer.</p> <p>All diamond drilling was NQ2 and oriented and logged geotechnically where possible.</p> <p>RC holes with diamond tails were drilled with an approximate max pre-collar depth of 300m. For shallower targets the pre-collar depth was designed 20m prior to intersecting the orebody.</p>                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Drill sample recovery</b>            | Method of recording and assessing core and chip sample recoveries and results assessed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>For all drilling, RC sample recovery is recorded at 1m intervals to assess that the sample is being adequately recovered during recover drilling operations. A subjective visual estimate is used and recorded as a percentage. Sample recovery is generally good, and there is no indication that sampling presents a material risk for the quality of the evaluation of the Majestic deposit.</p> <p>For diamond drilling recovered core for each drill run is recorded and measured against the expected core from that run. Core recovery is consistently very high, with minor loss occurring in regolith and heavily fractured ground. There is no indication that sampling presents a material risk for the quality of the evaluation of the Majestic deposit.</p> |

| Logging                                        | Measures taken to maximise sample recovery and ensure representative nature of the samples.                                                                                                                                                                                                                    | Sample representativity was checked through the use of duplicates with acceptable results throughout the life of the project.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|                                                | Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.                                                                                                                                               | No specific study has been carried out on recovery and grade. As recoveries are generally very high (95%+) it is assumed that the potential for bias due to variable sample recovery is low.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                                                | Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.<br>Whether logging is qualitative or quantitative in nature.<br>Core (or costean, channel, etc) photography. | Historic logging and photographs do not exist.<br>Logging of reverse circulation chips record lithology, mineralogy, texture, mineralisation, weathering, colour, alteration, veining and structure.<br>Diamond core was geologically logged and sampled by for lithology, mineralogy, texture, mineralisation, weathering, colour, alteration, veining and structure. Geotechnical measurements on DD core include RQD and Recovery. Logging is captured in excel templates which are then sent to the database geologists to upload to Acquire.<br><br>Geology logging is qualitative in nature with visual estimates made of mineralisation percentages for core. Structural and geotechnical logging is quantitative in nature. All core is photographed wet as standard practice.                                                                                                                                                                                                                                                  |
| Sub-sampling techniques and sample preparation | The total length and percentage of the relevant intersections logged.                                                                                                                                                                                                                                          | All relevant drilling has been logged in full.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                                | If core, whether cut or sawn and whether quarter, half or all core taken.                                                                                                                                                                                                                                      | Historic diamond core and 2020-2021 Black Cat diamond core is sawn half core using a diamond-blade saw, with the same half of the core consistently taken for analysis. The un-sampled half of diamond core is retained for check sampling if required.<br>2026 Black Cat diamond core is whole sampled as forms our grade control drilling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                                                | If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.                                                                                                                                                                                                                  | For Integra and Silver Lake:<br>Drill cuttings are extracted from the RC return via cyclone. The underflow from each 1 m interval is transferred via bucket to a 75/12.5/12.5% riffle splitter, delivering approximately three kilograms of the recovered material into calico bags for analysis.<br>Sample moisture (i.e. whether dry, moist, wet) is logged.<br>For Black Cat:<br>RC sampling is cone split to 1m increments on the rig. The vast majority of sampling has been dry. Where wet samples have been encountered, the hole is conditioned and splitter cleaned to prevent downhole contamination.                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                                                | For all sample types, the nature, quality and appropriateness of the sample preparation technique.                                                                                                                                                                                                             | For Integra and Silver Lake:<br>All samples are sorted and dried upon arrival to ensure they are free of moisture prior to pulverising. Samples that are too coarse to fit directly into a pulverising vessel will require coarse crushing to nominal 10mm. Samples >3kg are sub split to a size that can be effectively pulverised.<br>Representative sample volume reduction is achieved by either riffle splitting for free flowing material or rotary splitting for pre-crushed (2mm) product. All samples are pulverised utilising 300g, 1000g, 2000g and 3000g grinding vessels determined by the size of the sample.<br>Sample preparation follows industry standard practice. Samples are oven dried until a constant mass is achieved. All samples are then processed through an Essa Jaw Crusher or a Boyd Crusher to 90% < 3 mm. The crushed sample is then pulverised for 4 minutes in an LM5 pulveriser for a product of 90% passing < 75 µm. Approximately 250 - 300 g of the pulp is retained and a 40g charge prepared. |
|                                                | Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.                                                                                                                                                                                                          | A grind quality target of 85% passing 75µm has been established and is relative to sample size, type and hardness. MinAnalytical utilises low chrome steel bowls for pulverising. On completion of analysis all solid samples are stored for 60 days.<br>Black Cat's sample preparation adheres to industry best practice. It is conducted by a commercial laboratory and involves oven drying, coarse crushing then total grinding to a size of 90% passing 75µm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                                                | Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second half sampling.                                                                                                                                       | For all RC drilling, field duplicate samples were carried out at a rate of 1:50 and were sampled directly from the on-board splitter on the rig. These are submitted for the same assay process as the original samples and the laboratory are unaware of such submissions.<br>Pulp duplicates for DD are inserted ad hoc and completed as part of the laboratory check process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|                                                | Whether sample sizes are appropriate to the grain size of the material being sampled.                                                                                                                                                                                                                          | Sample sizes of between 2-3kg are considered to be appropriate for the deposit.<br>Grind checks are performed at both the crushing stage (3mm) and the pulverising stage (75µm) requiring 90% of material to pass through the relevant size. No specific study has been carried out to determine optimum sub-sample size fractions. These material sizes are assumed to be acceptable for the mineralization style and material grain size present.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Annual Mineral Resource and Ore Reserve Statement

| Section 1: Sampling Techniques and Data                 |                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criteria                                                | JORC Code Explanation                                                                                                                                                                                                            | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Quality of assay data and laboratory tests              | The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.                                                                                 | All samples are analysed by an external laboratory. Integra and Silver Lake used a 50g fire assay with AAS finish for gold analysis. Cu has been assayed using a 10g Charge - Aqua-Regia digest with Inductively Coupled Plasma Optical Emission Spectrometry. Black Cat samples are analysed by an external laboratory using a 40g fire assay with AAS finish. This method is considered suitable for determining gold concentrations in rock and is a total digest method. These methods are considered suitable for determining gold concentrations in rock and are a total digest method.                                                                                                                                           |
|                                                         | For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. | No geophysical tools were used in this Mineral Resource.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                                                         | Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.                 | Integra Mining and Silver Lake had a full QAQC program, with standards, blanks and field duplicates submitted with each batch of samples. Black Cat's drilling adheres to strict QAQC protocols involving weighing of samples, collection of field duplicates and insertion of certified reference material (blanks and standards). QAQC data are checked against reference limits in the Acquire database on import. The laboratory performs a number of internal processes including repeats, standards and blanks (inserted at a ratio of 1:20). Analysis of this data displayed acceptable precision and accuracy. Historic QAQC procedures are unknown but assumed to be industry standard. Adhoc laboratory audits are conducted. |
| Verification of sampling and assaying                   | The verification of significant intersections by either independent or alternative company personnel.                                                                                                                            | Significant intercepts are verified by database, geological and corporate staff.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|                                                         | The use of twinned holes.                                                                                                                                                                                                        | A number of historic twinned holes have been completed at the deposits. While the twinning has highlighted the variable and nuggety nature of the mineralisation, no issues have been observed in representativity of sampling.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|                                                         | Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.                                                                                                       | All logging is completed in the field on a tablet before being sent to the database administrator for upload into Acquire. Assay files are uploaded into the Acquire database by the database administrator.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                                                         | Discuss any adjustment to assay data.                                                                                                                                                                                            | No adjustments have been made to the assay data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Location of data points                                 | Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.                                                      | All surface drilling was marked out using a handheld GPS prior to drilling. Once complete, the hole collars are picked up by an external contractor using RTK GPS. Downhole surveys are conducted by the drilling contractor at the end of each hole using a down hole north seeking gyro. Underground diamond drilling is marked out by the survey department and then picked up after drilling. North seeking gyroscopic data is collected every 5m downhole, uploaded to Index for approval then import into the Acquire database.                                                                                                                                                                                                   |
|                                                         | Specification of the grid system used.                                                                                                                                                                                           | All drilling is completed using the grid system GDA 1994 MGA Zone 51.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                                                         | Quality and adequacy of topographic control.                                                                                                                                                                                     | Topography has been defined by drill hole collars, with the mined pits picked up by survey.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Data spacing and distribution                           | Data spacing for reporting of Exploration Results.                                                                                                                                                                               | The nominal spacing ranges from 15 by 15 to generally 50m by 50m for Au. Cu sampling has been selectively completed on an approximate 50m by 50m grid targeting zones of higher gold within some holes within the mined open pits, extending below the mined pits by approximately 100-150m. Cu has not been evaluated in this Mineral Resource.                                                                                                                                                                                                                                                                                                                                                                                        |
|                                                         | Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.     | The data spacings in the ore lodes at Majestic are considered sufficient to support the definition of Mineral Resources and Ore Reserves as applied under the 2012 JORC Code. Appropriate geological and grade continuity have been demonstrated during the development and stoping of Majestic in the underground (since 2025).                                                                                                                                                                                                                                                                                                                                                                                                        |
| Orientation of data in relation to geological structure | Whether sample compositing has been applied.                                                                                                                                                                                     | No sample compositing has been applied. The datasets were composited to 1m intervals prior to grade estimation. This aligns with the most common sample length taken.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                                                         | Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.                                                                       | Exploration drilling has generally been drilled towards the east at -60 to intersect the mineralised zones, with a couple of holes drilled in different orientations. A number of holes were drilled down dip which have been excluded from estimation. Grade control drilling in the open pit (fully mined out) was drilled at -60 to the east. These orientations are acceptable given the angle of dip the mineralisation has.                                                                                                                                                                                                                                                                                                       |
|                                                         | If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.                       | All drilling from surface has been drilled as close to perpendicular to the predicted orientation of stratigraphy as possible. This has reduced the risk of introducing a sampling bias as far as possible. Holes with orientations that are considered likely to introduce sampling bias are flagged during drill hole validation and are excluded from the Mineral Resource estimation datasets.                                                                                                                                                                                                                                                                                                                                      |
| Sample security                                         | The measures taken to ensure sample security.                                                                                                                                                                                    | All samples are prepared on site by company geological staff. Samples are selected, collected into tied calico bags and delivered to the laboratory by staff or contractors directly. Each sample batch is accompanied with a:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Annual Mineral Resource and Ore Reserve Statement

| Section 1: Sampling Techniques and Data |                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Exploration done by other parties</b>                                                                           | Acknowledgment and appraisal of exploration by other parties.                                                                                                                                                                                                                | <p>Small mining operations were conducted on and off in the Majestic mining area during 1900 – 1920's.</p> <p>The area was first professionally explored for Nickel mineralisation during the late 1960's and early 1970's by Broken Hill Proprietary Company and Titanium Australia Pty Ltd. The activities failed to identify any ultramafic units in the area and concluded there was no potential for nickel mineralisation.</p> <p>Dundas Gold Corporation NL pegged prospecting licences over the area during the 1980s but withdrew shortly afterwards due to the extensive soil cover.</p> <p>Between 1985 and 1987, Hillmin Gold Mines NL undertook mapping and geochemical sampling along with limited RAB and RC drilling.</p> <p>Western Mining Corporation picked up the tenements in 1989 and during the subsequent five years carried out intensive exploration over the project. The program included gridding, geological and regolith mapping, surface rock chip and auger sampling, geophysical surveys, RC, RAB and DD drilling programs.</p> <p>In 1995, WMC entered into a joint venture agreement with Homestake Gold of Australia who undertook responsibility for ongoing exploration on the tenements. Their efforts were directed towards further drilling and gridding programs.</p> <p>In 1996 Red Back Mining took over the leases and commenced exploration which included geological mapping, limited RC drilling, and examination of trace element data collected from WMC. Red Back conducted an end of hole characterisation exercise, classifying felsic lithologies into granitic or volcanic. This defined the Majestic stock as being 5km north-south and 3km east-west.</p> <p>Solomon (Australia) obtained the tenements in 2000 and entered into a JV agreement with Aurion Gold / Placer Dome Asia Pacific (formerly Goldfields) in May 2001, whereby Aurion Gold become the manager of the "Kalgoorlie Southeast Project".</p> <p>In June 2003, Newcrest entered into a JV Agreement with Solomon and began managing the tenure. Newcrest carried out both regional and prospect scale sampling and drilling programs over the area.</p> |

## Annual Mineral Resource and Ore Reserve Statement

| Section 2: Reporting of Exploration Results (Criteria listed in the preceding section also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

This granitoid is primarily equigranular and contains up to 20% quartz local textural variations are common ranging from more aphanitic (proximal to the dykes), to locally phaneritic where minimal alteration or intrusion has occurred. Numerous mafic clots up to 10cm in diameter punctuate the rock made up primarily of biotite accompanied by accessory amounts of other ferromagnesian minerals (hornblende &amp; ilmenite).</p> <p>The pluton has been intruded by multiple generations of dykes one series are the primary host of the mineralisation (Aplitic composition) while the later swarm truncate and terminate the mineralisation (Tonalitic composition).</p> <p>The Mount Monger region in which is located Majestic is dominated by a generally north-south striking and westerly dipping structural architecture.</p> <p>Locally within Majestic, the typical North-South strike is the primary trend with the strike varying locally from NNW to NNE. The observed westerly dip is moderate (550-650) with local exceptions up to 750. This structural framework provides the pathway for the primary mineralisation, expressed as altered felsic dykes (Aplitic) accompanied by elevated sulphides (Pyrite-Chalcopyrite-Arsenopyrite) and silica-sericite-biotite alteration. Within these mineralised structures, a high-grade southern plunge has been observed at ~350.</p> <p>Secondary structures present are a series of low angle thrust faults which share the North-South strike but dip at a much lower angle. These thrusts offset the ore body and act as a groundwater conduit. The thrust faults dip between 250-300 one dipping to the east while the other dips to the west.</p> <p>Two distinct styles of mineralisation are observed within the area. One of which is associated with the dykes and the other with the later veins of varying composition and orientation.</p> <ul style="list-style-type: none"> <li>• Dyke associated mineralisation: <ul style="list-style-type: none"> <li>o NNW-NNE orientation, westerly dipping and varying width from cm to m scale.</li> <li>o Elevated Gold generally associated with increase in pyrite, sericite and silica content.</li> <li>o Gold expressed both as coarse inclusions in the groundmass and as micro gold inclusions within other minerals (sulphides)</li> </ul> </li> <li>• Vein associated mineralisation: <ul style="list-style-type: none"> <li>o Thin, discrete and randomly orientated.</li> <li>o Elevated Gold is related to veins proximal to or cross cutting mineralised dykes.</li> <li>o Vein assemblage is variable, biotite-pyrite-albite rich veins and recrystallised quartz veins have the strongest correlation with Gold (Keric 2012).</li> <li>o Later stage albite-silica-hematite alteration overprints mineralised veins.</li> </ul> </li> </ul> <p>Based on fluid inclusion work, mineralising fluids are thought to be derived from a magmatic derived fluid source. Changes in composition are thought to be due to a slowly cooling system. Mineralisation appears to have occurred relatively early, with later stage veining and alteration overprinting mineralised structures.</p> |
| <b>Drill hole information</b>                                                                                      | <p>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</p> <ul style="list-style-type: none"> <li>- easting and northing of the drill hole collar;</li> <li>- elevation or Reduced Level ("RL") (elevation above sea level in metres) of the drill hole collar;</li> <li>- dip and azimuth of the hole;</li> <li>- down hole length and interception depth;</li> </ul> | <p>All the drill hole data was used directly or indirectly for the preparation of the resource estimates described in the resource report. Exclusion of the drill information will not detract from the understanding of the report.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Annual Mineral Resource and Ore Reserve Statement

| Section 2: Reporting of Exploration Results (Criteria listed in the preceding section also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                               |

| Criteria                                                                                                           | JORC Code Explanation                                                                                                                                                                                                                                                                                                                                                                 | Commentary                                                                                                                                                                                                                                                                                                    |
|                                                                                                                    | <ul style="list-style-type: none"> <li>– hole length; and</li> <li>– if the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li> </ul>                                                       |                                                                                                                                                                                                                                                                                                               |
| Data aggregation methods                                                                                           | In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g. cutting of high-grades) and cut-off grades are usually Material and should be stated.                                                                                                                                                                                | No exploration results reported within this announcement                                                                                                                                                                                                                                                      |
|                                                                                                                    | Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.                                                                                                                                | No exploration results reported within this announcement                                                                                                                                                                                                                                                      |
|                                                                                                                    | The assumptions used for any reporting of metal equivalent values should be clearly stated.                                                                                                                                                                                                                                                                                           | No metal equivalent values have been used for the reporting of these exploration results.                                                                                                                                                                                                                     |
| Relationship between mineralisation widths and intercept lengths                                                   | These relationships are particularly important in the reporting of Exploration Results.<br>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.<br>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').   | True widths have been calculated for intersections of the known ore zones, based on existing knowledge of the nature of these structures.<br>Both the downhole width and true width have been clearly specified when used.<br>Where mineralisation orientations are not known, downhole lengths are reported. |
| Diagrams                                                                                                           | Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include, but not be limited to a plan view of drill hole collar locations and appropriate sectional views.                                                                                                                    | Appropriate diagrams were released at time of Resource announcement. Refer to the relevant Resource Announcement listed in Notes on Resources under Gold Resource Table of this announcement.                                                                                                                 |
| Balanced reporting                                                                                                 | Where comprehensive reporting of all Exploration Results are not practicable, representative reporting of both low and high-grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.                                                                                                                                                            | No exploration results reported within this announcement                                                                                                                                                                                                                                                      |
| Other substantive exploration data                                                                                 | Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances. | Geophysical surveys including aeromagnetic surveys have been carried out by previous owners to highlight and interpret prospective structures in the project area. No geophysics was used in the production of the Mineral Resource.                                                                          |
| Further work                                                                                                       | The nature and scale of planned further work (e.g. tests for lateral extensions or depth extensions or large-scale step-out drilling).<br>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.                                           | Black Cat plans to conduct continue underground drilling in the area to confirm the current interpretation and target extensions to the currently modelled mineralisation.<br><br>Appropriate diagrams accompany this release.                                                                                |

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                 |                                                                                                                                                                    |
|-------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criteria                                                                                                                                              | JORC Code Explanation                                                                                                                                                                           | Commentary                                                                                                                                                         |
| Database integrity                                                                                                                                    | Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes. | The data used for generating the Mineral Resource estimates is stored in an Acquire database. The Company employs a database administrator to manage the database. |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Criteria                                                                                                                                              | JORC Code Explanation                                                                                                                                                                                                                                                                                                                                                                              | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|                                                                                                                                                       | Data validation procedures used.                                                                                                                                                                                                                                                                                                                                                                   | <p>Where possible, raw data is loaded directly into the database. Extensive validation checks are built into the AcQuire database to ensure data integrity and the data uploaded is date stamped with a user identifier. Data is also interrogated in 3D space to ensure that the location, geology and assays match surrounding holes.</p> <p>Checks carried out on the imported Black Cat data include:</p> <ul style="list-style-type: none"> <li>• Collar details import checks – start and end dates are supplied, collar has location coordinates, end of hole information has been updated from plan.</li> <li>• Survey details import checks – surveys are approved in Index and once approved, uploaded to AcQuire. Checks are made to compare the planned dip and azimuth to the actual dip and azimuth to ensure the correct data is approved and uploaded.</li> <li>• Geology details import checks – final lithology depth is within tolerance with respect to end of hole depth, structural measurements are present, and no overlapping intervals exist.</li> <li>• Sample/Assay import checks – total sample metres match end of holed depth, no duplicate samples with the same priority exist, sample intervals are continuous, no assay values have negative values, despatch return date is recorded, QAQC checks have passed.</li> <li>• Geotechnical details import checks – logged information depths are within tolerance with respect to end of hole depth.</li> <li>• Bulk Density/SG detail checks – logged information depths are within tolerance with respect to end of hole depth.</li> </ul> <p>Errors are corrected where possible. When not possible, the data is flagged as 'invalid' in the database and excluded from the estimation process.</p> <p>Historic data was imported into AcQuire. A lot of the survey type information is missing, therefore the following checks were completed to assess the validity:</p> <ul style="list-style-type: none"> <li>• Collar coordinates aren't rounded</li> <li>• Collar coordinates have recorded survey method</li> <li>• Downhole surveys present, or 0m present for short holes (&lt;50m)</li> <li>• Holes with deviation recorded and greater than 30m between survey points are marked as 'invalid' for estimation</li> <li>• Where historic holes have been planned to intersect development and do not, or where we intersect holes where not expected – these are marked as 'invalid' if the location is &gt;4m away from what is recorded in the database.</li> </ul> |
| <b>Site visits</b>                                                                                                                                    | Comment on any site visits undertaken by the Competent Person and the outcome of those visits.<br>If no site visits have been undertaken indicate why this is the case.                                                                                                                                                                                                                            | The geological interpretations underpinning the resource model was prepared by the Resource Superintendent, with input from the Senior and Project Geologists on site, who are in direct, daily contact with the ore body. The estimation of grades was undertaken by the Resource Superintendent, who completed regular site visits. The Principal Resource Geologist, a Competent Person for reviewing and signing off on estimations at Majestic maintained a site presence through site visits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Geological interpretation</b>                                                                                                                      | Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.<br>Nature of the data used and of any assumptions made.<br>The effect, if any, of alternative interpretations on Mineral Resource estimation.<br>The use of geology in guiding and controlling Mineral Resource estimation.<br>The factors affecting continuity both of grade and geology. | <p>The resource categories assigned to the model directly reflect the confidence of the geological interpretation that is built using local, structural, mineral, and alteration geology obtained from geophysics, logging, drilling results and mapping.</p> <p>The geological interpretation of Majestic has considered all available geological information. RC and Diamond drilling was used during interpretation with the exclusion of RAB and AC due to the lack of confidence in the technique for modelling and estimation. Face mapping and channel samples were utilised in the interpretation of the lodes (but not in the estimation). Mineralisation was implicitly modelled in Leapfrog Geo, as a series of north-south striking, moderate to steeply dipping lodes to the west. Logging of the aplite was used to guide the interpretations, along with assay grades. Lower grades were included within the interpretation where geologically continuous and were further sub-domained into high and low grade domains through indicator estimation. The halo interpretation is a numerical model surrounding the ore lodes in an aim to capture the discontinuous grade that lies outside of the ore lodes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Dimensions</b>                                                                                                                                     | The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.                                                                                                                                                                                                     | The Majestic Resources extend over a strike length of 790 m (from 6,581,030 mN to 6,581,820 mN) and includes the vertical extent of 534 m from 320mRL to -120mRL.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Estimation and modelling techniques                                                                                                                   | <p>The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</p> <p>The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</p> <p>The assumptions made regarding recovery of by-products.</p> <p>Estimation of deleterious elements or other non-grade variables of economic significance (e.g. sulphur for acid mine drainage characterisation).</p> <p>In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.</p> <p>Any assumptions behind modelling of selective mining units.</p> <p>Any assumptions about correlation between variables.</p> <p>Description of how the geological interpretation was used to control the resource estimates.</p> <p>Discussion of basis for using or not using grade cutting or capping.</p> <p>The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.</p> | <p>Grade estimation for gold was completed using Datamine Studio RM v3.1.39 software. Geostatistical analysis and variography were completed using Snowden Supervisor v9.2.4.</p> <p>The Majestic Resource Model consists of ore lodes and mineralisation halos. The halo has been included to provide a realistic estimate of grades sitting between and adjacent to currently interpreted ore lodes.</p> <p>Ore lodes – each ore lode interpretation is considered as being a separate estimation domain. All estimations use hard domain boundaries. Estimations for gold utilise a grade indicator estimation (with individual grade cut-offs for low grade and high grade for each ore lode) at 0.5 probability to further sub-domain the ore lodes. Within each sub-domain, estimations were completed using Ordinary Kriging. Estimations use 1m composites with grade capping applied to gold outlier values. Histograms, log probability plots, mean and variance plots and change in CV of the 1m composites were used to determine capping values on a domain by domain basis. Both hard top-cuts and influence limitation top-cuts were applied where necessary. Search ellipse orientation and size were based on variogram rotations and variogram ranges on a domain by domain basis. Lodes that did not have enough samples to complete a realistic variogram were assigned the variogram of a similar oriented lode. A multiple-pass estimation strategy was applied for estimations. KNA was completed to determine the optimal search distance and minimum and maximum samples.</p> <p>Halo – similar approach to the ore lode estimation, however restricted search distances and limited to a 2-pass estimate was utilised to limit the estimate and remove potential smearing.</p> <p>Comparison estimates were carried out by Inverse Distance Squared and Nearest Neighbour methods for each model domain alongside the Ordinary Kriged estimates.</p> <p>No assumptions are made on recovery of by-products.</p> <p>No other elements were estimated.</p> <p>Block sizes were selected based on drill spacing and the thickness of the mineralised veins with sub blocking utilised to honour estimation domain volumes:<br/>Majestic – 2.5m (east) by 5m (north) by 5m (z) sub blocking down to 0.625m/0.625m/0.625m. The indicator estimation is estimated into 1m blocks in an attempt to produce well-defined sub-domains with granularity. The grade estimation was estimated into the parent blocks.<br/>Average drill spacing ranges from 15m x 15m, down to 75m x 75m at mineralisation depths and extents.</p> <p>No selective mining units were assumed in the resource estimate.</p> <p>No assumptions about correlation between variables was made. Gold was estimated independently, and density was hard-coded into the model based on the oxide-transitional-fresh contacts.</p> <p>Ore lodes and Halo interpretations were created using implicit modelling within Leapfrog Geo. The Halo interpretation further utilised numeric modelling. The ore lodes were used to define the high-grade continuous mineralisation, whilst the Halo captures the discontinuous mineralisation outside of the ore lodes. Each lode is considered as being a separate estimation domain. All estimations use hard domain boundaries.</p> <p>Top-cuts were applied to the composited sample data with the intention of reducing the impact of outlier values on the average grade. Top cuts were selected based on a statistical analysis of the data with a general aim of not impacting the mean by more than 10% and reducing the coefficient of variation to around 2 and vary by domain.</p> <p>The top cut values are applied in several steps, using a technique called influence limitation top capping. A top cut (AU) and non-top cut (*_NC) variable is created, as well as a spatial variable (*_BC) which only has values where the top cut values appear; this</p> |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

|                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>applies to both gold and true thickness (TT) top cutting. For example, where gold requires a top cut, the following variables will be created and estimated:</p> <ul style="list-style-type: none"> <li>AU (top cut gold)</li> <li>AU_NC (non- top-cut gold)</li> <li>AU_BC (spatial variable; values present where AU data is top cut)</li> </ul> <p>The top-cut and non-top cut values are estimated using search ranges based on the modelled gold variogram, and the *_BC values estimated using very small ranges (e.g. 5 x 5 x 5m). Where the *_BC values produce estimated blocks within these restricted ranges, the *_NC estimated values replace the original top cut estimated values (AU).</p> <p>A hard top cut is applied instead of/as well in the following situations:</p> <ul style="list-style-type: none"> <li>If there are extreme outliers within an ore domain</li> <li>If the area has a history of poor reconciliation (i.e. overcalling)</li> </ul> <p>Statistics are generated and analysed using Snowden Supervisor software for the raw, composited and capped and composited drill hole files to ensure the nature of the population has not been adversely affected by these processes. Statistical measures of Kriging error, such as Kriging Efficiency and Slope of Regression, are used to assess the quality of the estimation for each domain. Differences between the composite data set and the average model grade must be within 10%. Swath plots comparing composites to block model grades are prepared and visual checks summarising the critical model parameters. Declustering is reviewed to see the impact it has on the mean sample grade. Visually, block grades are assessed against drill hole data.</p> |
| <b>Moisture</b>                                                                                                                                       | Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content                                                                                                                                                                                                                                                                                                                                                                                                                | All estimations are carried out on a 'dry' basis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Mining factors or assumptions</b>                                                                                                                  | Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made. | No mining assumptions have been made during the resource wireframing or estimation process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Metallurgical factors or assumptions</b>                                                                                                           | The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.                             | The mineralisation at Majestic is amenable to processing through the Lakewood mill. No metallurgical assumptions have been built or applied to the Resource model.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Environmental factors or assumptions</b>                                                                                                           | Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early                                                                                  | A "Licence to Operate" is held by the operation which is issued under the requirement of the "Environmental Protection Act 1986", administered by the Department of Environment (DoE). The licence stipulates environmental conditions for the control of air quality, solid waste management, water quality, and general conditions for operation. Groundwater licenses are held for water abstraction, including production bore field water use for mineral processing, and mine dewatering, in accordance with the Rights in Water and Irrigation Act 1914. These licenses are also regulated by DoE and are renewable on a regular basis. Black Cat                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                                                                                                                                                       | consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Syndicate conduct extensive environmental monitoring and management programs to ensure compliance with the requirements of the licences and lease conditions.<br>The Kalgoorlie operations are fully permitted including groundwater extraction and dewatering, removal of vegetation, mineral processing, and open pits.<br>A conventional storage facility is used for the process plant tailings.<br>Waste rock is to be stored in a traditional waste rock landform 'waste dump'. There is no evidence from previous mining to indicate the presence of deleterious elements within the Imperial or Majestic waste rock.                                                                                                                                                                                                                                                                                                                                                     |
| <b>Bulk density</b>                                                                                                                                   | Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples. The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit. Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.                                                                                                                                                                                                                                                                                                                                                                      | Bulk density is assigned based on regolith. Values of 1.80, 2.45 and 2.70 t/m <sup>3</sup> are used for oxide, transitional and fresh waste rock respectively.<br>Bulk density values were taken from historic test work and correlate well with results from other areas in the region with similar geology.<br>Density values are allocated uniformly to each regolith type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Classification</b>                                                                                                                                 | The basis for the classification of the Mineral Resources into varying confidence categories.<br>Whether appropriate account has been taken of all relevant factors (i.e. relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).<br>Whether the result appropriately reflects the Competent Person's view of the deposit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | There is no Measured Mineral Resources at Majestic.<br>Indicated mineralisation classification has been applied to those parts of each lode where the drill intercept spacing approximates 20m x 20m and has robust geological and mineralogical understanding and continuity. It has also generally been estimated on the first or second interpolation pass.<br>Inferred mineral resources are based on limited data support. No development for geological mapping; typically drill spacing greater than 20m x 20m and less than 60m x 60m.<br>Further considerations of resource classification include; Data type and quality (drilling type, drilling orientations, down hole surveys, sampling and assaying methods); Geological mapping and understanding; statistical performance including number of samples, slope regression and kriging efficiency.<br>The classification of the Mineral Resource estimate appropriately reflects the view of the Competent Person. |
| <b>Audits or reviews</b>                                                                                                                              | The results of any audits or reviews of Mineral Resource estimates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | The geological interpretation, estimation parameters and validation of the Resource model were peer reviewed by the Competent Person. No external audits were conducted this financial year.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Discussion of relative accuracy/ confidence</b>                                                                                                    | Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.<br>The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.<br>These statements of relative accuracy and confidence of the estimate should be compared with production data, where available. | The relative accuracy and confidence of the mineral resource model is reflected in the assigned Mineral Resource classifications.<br>The Majestic deposit is a global estimate. No reconciliation factors are applied to the resource post-modelling. The Mineral Resource was compared to the previous estimate, with similar results in areas of similar interpretation. Variations and increases in the Mineral Resource have resulted from extensional drilling and minor reinterpretation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Section 4: Estimation and Reporting of Ore Reserves |                                                                                                    |                                                                                                                                                                                                                               |

| <b>conversion to Ore Reserves</b>                   | Clear statement as to whether the Mineral Resources are reported additional to, or inclusive of, the Ore Reserves.                                                                                                                                                                                                                                                                                                                                                                                                                                                             | The Mineral Resources are reported inclusive of the Ore Reserves and are as stated in the Majestic Mineral Resource statements.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Site visits</b>                                  | Comment on any site visits undertaken by the Competent Person and the outcome of those visits.<br>If no site visits have been undertaken indicate why this is the case.                                                                                                                                                                                                                                                                                                                                                                                                        | Site visits were undertaken by the Competent Person for Ore Reserve assessment.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Study status</b>                                 | The type and level of study undertaken to enable Mineral Resources to be converted to Ore Reserves.<br>The Code requires that a study to at least Pre-Feasibility Study level has been undertaken to convert Mineral Resources to Ore Reserves. Such studies will have been carried out and will have determined a mine plan that is technically achievable and economically viable, and that material Modifying Factors have been considered.                                                                                                                                 | The level of study supporting the Ore Reserve estimate is considered to be at least Pre-Feasibility Study level. The estimate incorporates updated mine designs, production schedules, cost estimates and selected operational learnings gained during the development and ramp-up of Majestic Underground. The Competent Person is satisfied that the resulting mine plan is technically achievable and economically viable and that all material Modifying Factors have been considered.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Cut-off parameters</b>                           | The basis of the cut-off grade(s) or quality parameters applied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Breakeven grades were calculated using planned mining costs at a gold price of AUD \$4,500/oz. The calculated breakeven grades included the appropriate capital costs, mining costs, overheads, processing, royalties, and administration costs. All breakeven grades have been calculated after application of modifying factors (mining dilution, mining recovery, and mill recovery).<br><br>Majestic ore development breakeven grade: 0.5 g/t; incremental stope breakeven grade: 1.0 g/t; fully-costed stope breakeven grade: 2.3 g/t.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Mining factors or assumptions</b>                | The method and assumptions used as reported in the Pre-Feasibility or Feasibility Study to convert the Mineral Resource to an Ore Reserve (i.e. either by application of appropriate factors by optimisation or by preliminary or detailed design).<br><br>The choice, nature and appropriateness of the selected mining method(s) and other mining parameters including associated design issues such as pre-strip, access, etc.<br><br>The assumptions made regarding geotechnical parameters (eg pit slopes, stope sizes, etc.), grade control and pre-production drilling. | Detailed underground mine designs and schedules have been generated for the Majestic underground mine based on current mining practices, methods and technologies. The mine designs have been performed in accordance with standard operational constraints, equipment capabilities and geotechnical guidelines.<br><br>Ore development solids were broken into individual 3.0 m cut lengths and interrogated against the Mineral Resource model for tonnes and tonnes-weighted grade, inclusive of waste. Following depletion by development, stope shapes were interrogated against the Mineral Resource model to determine contained tonnes and grade. Mining dilution, mining recovery and Reserve cut-off criteria were subsequently applied to generate the Ore Reserve estimate.<br><br>Majestic capital development layouts and dimensions have been designed to suit medium to large sized diesel equipment (twin-boom jumbo, 10t-15t loaders and 50t-60t trucks); provisions have been made to accommodate all required mine infrastructure. Majestic ore drive dimensions have been designed at 4.0mW x 4.2mH to suit the nature of the orebody and for use of a small jumbo and 10t loader.<br><br>Deswik Stope Optimiser (SO) has been used to generate stope shapes meeting calculated cut-off criteria. A costing model has been used to assess project economics to ensure profitability.<br><br>The mining method selected for the Majestic underground is top-down sublevel open stoping with rib pillars. Stopes are to remain open with no in-cycle backfill to be used. Mine sublevel spacings are 18m -20m floor-to-floor. This mining method is widely employed in the Western Australian Goldfields for extraction of narrow-vein moderate to steeply-dipping orebodies and as such significant operational experience exists.<br><br>Rockfill has been scheduled, during the operational, mine life within key stoping areas to facilitate recovery of crown pillar at end of mine life.<br><br>Geotechnical analysis by a third party consultant characterises the Majestic rock mass as very good. Intact rock strength mean UCS values determined from test work range from 134 MPa to 220 MPa. Pit wall mapping and core logging have identified five |

## Annual Mineral Resource and Ore Reserve Statement

| Section 4: Estimation and Reporting of Ore Reserves |                                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Criteria                                            | JORC Code explanation                                                                                                                | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                                                     |                                                                                                                                      | <p>moderate to steeply-dipping rock defect sets with typical maximum trace length of 5m (drive scale). Mapped defects are typically planar to undulating, slightly rough to smooth and have predominantly clean surfaces.</p> <p>Estimated in-situ stress conditions are low, with the principal stress roughly parallel to the north-south strike of the orebody. The estimated principal stresses at the base of the Majestic Ore Reserve mine design are: <math>\sigma_1 = 20</math> MPa, <math>\sigma_2 = 15</math> MPa <math>\sigma_3 = 10</math> MPa.</p> <p>A minimum strike length of 15 m was applied to ensure stopes were operationally achievable and economically mineable. Maximum stope strike lengths have been limited to 50m to accommodate teleremote loading activities.</p> <p>Based on third-party geotechnical recommendations, rib pillar positions both along strike and down-dip are in accordance with a maximum allowable unsupported Hydraulic Radius (HR) of 10.5m. The maximum unsupported HR has been defined as the continuous unsupported span created both down-dip (over multiple levels) and along strike at the completion of mining excluding primary ground support of ore drives. An intact rock pillar meeting geotechnical guidelines, backfill, or dedicated deep support (9m long cable bolts) of the HW or FW would be required to consider the mining span supported.</p> <p>A minimum 7m intact rock pillar is required for extraction of parallel stopes. Rib pillars have been aligned where parallel stopes are mined at &lt;10m interstitial pillar to provide continuous HW to FW support. Rib pillars have been designed at full level height at a minimum strike length of 5m, although geotechnical recommendations allow for the use of partial-height island pillars.</p> <p>The decline at Majestic is positioned at a minimum standoff of 40m from the nearest continuous stoping panel to ensure long-term geotechnical stability.</p> <p>The Majestic underground Ore Reserve estimate was based on the July 2026 Mineral Resource estimate as at (30 July 2026), inclusive of past open pit mining depletion and 2025/26 underground mining activities.</p> <p>Stope shapes were generated using Deswik Stope Optimiser (SO) based on the current Majestic Mineral Resource Estimate. Stope sections were generated on 18-20 m floor-to-floor level spacing pending on being above or below the 160mrl using optimisation parameters informed by current mining and economic assumptions. Incremental and fully-costed break-even cut-off grades of 1.1 g/t Au and 1.9 g/t Au respectively were used during the optimisation process. Candidate stopes were combined and reviewed against geotechnical and operational design criteria, with final Reserve shapes meeting the applicable Reserve cut-off, modifying factor and Mineral Resource classification requirements.</p> <p>Stope design parameters included a minimum mining width of 1.8 m true width, a minimum footwall dip angle of 40°, and a minimum 7 m intact rock pillar between parallel stopes. These parameters were selected to ensure practical mining shapes while maintaining geotechnical stability.</p> <p>No additional dilution has been added to the development at Majestic due to competent rock mass conditions and the provision for perimeter control development blasting. Interrogated development cut grades are inclusive of waste contained inside the design drive profile.</p> <p>Interrogated stope tonnes and grades are inclusive of internal waste contained within the design shapes. An additional 10%-20% mining dilution by mass, at zero grade, has been applied to account for unplanned dilution. The assumption will be reviewed as additional stope reconciliation data become available. No further stope dilution has been applied in the mine schedule.</p> <p>A mining recovery factor of 100% has been applied to development and 95% was applied to stoping to account for unplanned ore loss.</p> <p>Solid shapes were interrogated against the Mineral Resource model to determine contained tonnes, grade and Mineral Resource classification. The dominant Resource classification by contained tonnes within each stope shape was used to determine</p> |
|                                                     | The major assumptions made and Mineral Resource model used for pit and stope optimisation (if appropriate).                          |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>Reserve inclusion. Where the majority of the contained tonnes within a solid shape were classified as Indicated Mineral Resource, the full mining shape was considered for inclusion in the Ore Reserve estimate.</p> <p>Provision has been made within the Majestic mine design for all necessary infrastructure including primary and secondary ventilation, mine power, mine dewatering, general services and communications.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Metallurgical factors or assumptions</b>         | <p>The metallurgical process proposed and the appropriateness of that process to the style of mineralisation.</p> <p>Whether the metallurgical process is well-tested technology or novel in nature.</p> <p>The nature, amount and representativeness of metallurgical test work undertaken, the nature of the metallurgical domaining applied and the corresponding metallurgical recovery factors applied.</p> <p>Any assumptions or allowances made for deleterious elements.</p> <p>The existence of any bulk sample or pilot scale test work and the degree to which such samples are considered representative of the ore body as a whole.</p> <p>For minerals that are defined by a specification, has the ore reserve estimation been based on the appropriate mineralogy to meet the specifications?</p> | <p>The metallurgical process proposed is two stage crushing and milling to 106µm with gravity recovery and carbon in leach extraction at Black Cat's Lakewood Processing Facility.</p> <p>The metallurgical process is well tested and commonly used in similar operations worldwide.</p> <p>The Ore Reserve estimation was based on recoveries established during metallurgical testing of Majestic samples carried out between 2011 and 2015. Average metallurgical recovery for Majestic has been assumed at 90%.</p> <p>The Ore Reserve estimation has been based on the recoveries and processes outlined above which are well tested and established as being appropriate for similar metallurgical specifications.</p> <p>No additional recovery reduction has been applied in excess of the Majestic metallurgical testwork where 90% recovery was inclusive of any reduction related with presence of copper.</p> <p>The Majestic and adjacent Imperial deposits have been mined as open pits between 2016 and 2018. Metallurgical testwork was in line with actual mill recoveries experienced during operations and therefore are representative for future use.</p> <p>Minor copper mineralisation is present within portions of the Majestic deposit. Metallurgical performance assumptions adopted in the Ore Reserve estimate are consistent with those applied in the supporting metallurgical studies.</p> <p>Costs have been included for haulage from the mine to the Lakewood inclusive of road maintenance.</p> |
| <b>Environmental</b>                                | <p>The status of studies of potential environmental impacts of the mining and processing operation. Details of waste rock characterization and the consideration of potential sites, status of design options considered and, where applicable, the status of approvals for process residue storage and waste dumps should be reported.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Various Environmental Studies have been completed by Black Cat Syndicate using various independent specialist consultants, as part of the Environmental Effects Statement process. All approvals have been granted for commencement of operations at Majestic.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Infrastructure</b>                               | <p>The existence of appropriate infrastructure: availability of land for plant development, power, water, transportation (particularly for bulk commodities), labour, accommodation; or the ease with which the infrastructure can be provided or accessed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>Short term hire infrastructure has been utilised on site. Previous open pit mining at the Majestic and Imperial mines has established the locations as a serviceable operational centre.</p> <p>The Majestic mining centre is 50km east of Kalgoorlie along gazetted roads; no limitations on accessing the required infrastructure, facilities, labour, or supplies are anticipated.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Economic</b>                                     | <p>The inputs to the economic analysis to produce the net present value (NPV) in the study, the source and confidence of these economic inputs including estimated inflation, discount rate, etc.</p> <p>NPV ranges and sensitivity to variations in the significant assumptions and inputs.</p>                                                                                                                                                                                                                                                                                                                                                                                              | <p>Economic analysis has been performed using an undiscounted cash flow method due to the short to medium term of the Majestic project. The costing model used for economic analysis is inclusive of all applicable capital and operating costs.</p> <p>Costs are based on price quotations supplied by manufacturers, suppliers, or contractors or derived from first principles designs build-up based on market rates. Where possible, multiple quotations have been obtained for comparison to ensure fair market conditions are being represented. The costing model is inclusive of costs associated with mine infrastructure, personnel, administration, consumables, mine overheads, fixed and variable operating costs, processing, and royalties and refining.</p> <p>Current contractor-supplied underground fixed and variable costs, along with associated assumptions, have been used for the Majestic Ore Reserve schedule. The short to medium-term mine life is expected to minimise cost variations.</p> |

Where the majority of the contained tonnes within a mining shape were classified as Indicated Mineral Resource, the full mining shape was considered for inclusion in the Ore Reserve estimate as Probable Ore Reserve.</p> <p>The result appropriately reflects the Competent Person's view of the deposit and the level of confidence in the supporting Mineral Resource Estimate and applied modifying factors.</p> <p>The Ore Reserve comprises Probable Ore Reserves derived from mining shapes that are predominantly classified as Indicated Mineral Resources. Ore Reserve classification was assigned based on the dominant Mineral Resource classification by contained tonnes within each mining shape. No Measured Mineral Resources occur within the supporting Mineral Resource Estimate</p> |
| <b>Audits or reviews</b>                            | The results of any audits or reviews of Ore Reserve estimates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | The Ore Reserve has undergone internal peer review.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Discussion of relative accuracy/ confidence</b>  | <p>Where appropriate a statement of the relative accuracy and confidence level in the Ore Reserve estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the reserve within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors which could affect the relative accuracy and confidence of the estimate.</p> <p>The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.</p> <p>Accuracy and confidence discussions should extend to specific discussions of any applied Modifying Factors that may have a material impact on Ore Reserve viability, or for which there are remaining areas of uncertainty at the current study stage.</p> <p>It is recognised that this may not be possible or appropriate in all circumstances. These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.</p> | <p>The Ore Reserve estimate has been prepared in accordance with the guidelines of the 2012 JORC Code and are in line with the Black Cat Syndicate Ore Reserve Processes. The modifying factors applied are consistent with comparable operations and suited to the rock mass conditions.</p> <p>Cut-off grades applied to the Majestic Ore Reserve estimate are conservative compared with calculated breakeven grades. Fluctuations in cost components and revenue factors are therefore accounted for in the Ore Reserve estimate.</p> <p>The Ore Reserve has undergone internal peer review.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Annual Mineral Resource and Ore Reserve Statement

### TROJAN

| Section 1: Sampling Techniques and Data |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criteria                                | JORC Code Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Commentary                                                                                                                                                                                                                                                                                                                                                                                                     |
| Sampling techniques                     | Nature and quality of sampling (e.g. cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.                                                                                                                                                                                                                                        | Drilling has been completed by numerous parties over the life of the project. Air core, RAB, reverse circulation, and diamond drilling have all been completed.                                                                                                                                                                                                                                                |
|                                         | Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.                                                                                                                                                                                                                                                                                                                                                                                                                         | The majority of drilling was completed between late 1980's and early 2000's by Mt Martin, Titan, Newcrest, and New Hampton Goldfields. QAQC was completed and reported for drilling completed by New Hampton and no issues were recorded. The close correlation between the Resource Model, grade control model, and reconciled production figures indicates acceptable representativity in the drilling data. |
|                                         | Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (e.g. 'reverse circulation drilling was used to obtain 1m samples from which 3kg was pulverised to produce a 30g charge for fire assay'). In other cases, more explanation may be required, such as where there is coarse gold that has inherent sampling problems. Unusual commodities or mineralisation types (e.g. submarine nodules) may warrant disclosure of detailed information. | The bulk of the drilling has been completed as industry standard techniques. RC drilling makes up most of the informing samples, with 4m composites generally being taken, with any anomalous results being re-split by riffle splitter into 1m intervals of approximately 2-3kg.<br><br>Sample analysis has taken place at reputable commercial laboratories with generally a 50g fire assay completed.       |
| Drilling techniques                     | Drill type (e.g. core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (e.g. core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).                                                                                                                                                                                                                                                                               | Reverse circulation drilling was completed using a face sampling percussion hammer.<br><br>Diamond drilling was oriented and logged geotechnically.<br><br>Historical reverse circulation drilling size is unknown.                                                                                                                                                                                            |
| Drill sample recovery                   | Method of recording and assessing core and chip sample recoveries and results assessed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Where recovery has been recorded, it has generally been dry with good recovery.                                                                                                                                                                                                                                                                                                                                |
|                                         | Measures taken to maximise sample recovery and ensure representative nature of the samples.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Duplicates are not mentioned in any detail; however, the twinning of holes and reconciliation of production data indicates good representivity.                                                                                                                                                                                                                                                                |
|                                         | Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.                                                                                                                                                                                                                                                                                                                                                                                                      | There is no known relationship between sample recovery and grade for drilling completed.                                                                                                                                                                                                                                                                                                                       |
| Logging                                 | Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.                                                                                                                                                                                                                                                                                                                                                                     | Logging of reverse circulation chips record lithology, mineralogy, texture, mineralisation, weathering, colour, alteration, veining and structure.<br><br>Diamond core was geologically logged and sampled by for lithology, mineralogy, texture, mineralisation, weathering, colour, alteration, veining and structure.                                                                                       |
|                                         | Whether logging is qualitative or quantitative in nature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | No historic core or chips are available                                                                                                                                                                                                                                                                                                                                                                        |

## Annual Mineral Resource and Ore Reserve Statement

| Section 1: Sampling Techniques and Data        |                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                   |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Sub-sampling techniques and sample preparation | Core (or costean, channel, etc) photography.                                                                                                                                                                                     |                                                                                                                                                                                                                                   |
|                                                | The total length and percentage of the relevant intersections logged.                                                                                                                                                            | All relevant drilling has been logged in full.                                                                                                                                                                                    |
|                                                | If core, whether cut or sawn and whether quarter, half or all core taken.                                                                                                                                                        | Diamond core was generally sampled as 1m intervals as half core                                                                                                                                                                   |
|                                                | If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.                                                                                                                                    | All samples were bagged from the rig. Most samples were composited for preliminary analysis with any anomalous grades resampled by riffle splitter into 1m intervals<br>There sampling was generally dry as per historic reports. |
|                                                | For all sample types, the nature, quality and appropriateness of the sample preparation technique.                                                                                                                               | The laboratory preparation of samples adheres to industry best practice. It is conducted by a commercial laboratory and involves oven drying, coarse crushing then total grinding.                                                |
|                                                | Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.                                                                                                                            | All subsampling activities are carried out by commercial laboratory and are considered to be satisfactory.                                                                                                                        |
|                                                | Measures taken to ensure that the sampling is representative of the in-situ material collected, including for instance results for field duplicate/second half sampling.                                                         | QAQC is not discussed in detail. The close correlation between the Resource Model, grade control model, and reconciled production figures indicates acceptable representativity in the drilling data.                             |
| Quality of assay data and laboratory tests     | Whether sample sizes are appropriate to the grain size of the material being sampled.                                                                                                                                            | Sample sizes of between 2-3kg are considered to be appropriate for the deposit.                                                                                                                                                   |
|                                                | The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.                                                                                 | All samples are analysed by an external laboratory. The bulk of samples used a 50g fire assay. These methods re considered suitable for determining gold concentrations in rock and are a total digest method.                    |
|                                                | For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. | No geophysical tools were used in this Mineral Resource.                                                                                                                                                                          |
| Verification of sampling and assaying          | Nature of quality control procedures adopted (e.g. standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (i.e. lack of bias) and precision have been established.                 | Historic drilling had limited QAQC completed, limited to repeats of assays. A number of confirmation drill programs have been completed to test the accuracy of historic holes by various owners over time.                       |
|                                                | The verification of significant intersections by either independent or alternative company personnel.                                                                                                                            | Significant intercepts are verified by database, geological and corporate staff.                                                                                                                                                  |
|                                                | The use of twinned holes.                                                                                                                                                                                                        | Diamond twinning has not been completed at this point. A number of confirmation drill programs have been completed to test the accuracy of historic holes by various owners over time.                                            |
| Verification of sampling and assaying          | Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.                                                                                                       | Data has been reviewed from the digital file to the hard copies of annual reports with limited errors observed at this point.                                                                                                     |

## Annual Mineral Resource and Ore Reserve Statement

| Section 1: Sampling Techniques and Data                 |                                                                                                                                                                                                                              |            |                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                   |         |      |       |  |  |                   |  |  |          |      |       |    |      |       |    |            |           |           |         |             |               |         |            |           |            |         |             |               |         |

| Criteria                                                | JORC Code Explanation                                                                                                                                                                                                        |            |                                                                                                                                                            | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                   |         |      |       |  |  |                   |  |  |          |      |       |    |      |       |    |            |           |           |         |             |               |         |            |           |            |         |             |               |         |
|                                                         | Discuss any adjustment to assay data.                                                                                                                                                                                        |            |                                                                                                                                                            | No adjustments were complete on the assay data prior to loading into the database. Top cutting was completed as needed during the estimation process.                                                                                                                                                                                                                                                                                                                                                                                                                        |                   |         |      |       |  |  |                   |  |  |          |      |       |    |      |       |    |            |           |           |         |             |               |         |            |           |            |         |             |               |         |
| Location of data points                                 | Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.                                                  |            |                                                                                                                                                            | Hole surveys for drilling prior to New Hampton Goldfields were proven to an issue during mining with limited information on collar location and no downhole surveys. New Hampton used GPS to locate collars and downhole surveyed any hole longer than 30m. The method of survey is unspecified. As the majority of holes drilled prior to New Hampton have since been mined out, the lack of survey control in these holes represents a limited risk only.                                                                                                                  |                   |         |      |       |  |  |                   |  |  |          |      |       |    |      |       |    |            |           |           |         |             |               |         |            |           |            |         |             |               |         |

| Data spacing and distribution                           | Data spacing for reporting of Exploration Results.                                                                                                                                                                           |            |                                                                                                                                                            | The nominal spacing ranges from 3.5m (northing) by 3.5m (easting) within the grade controlled area (mostly mined) to 30m by 50m at the extremities of the deposit.                                                                                                                                                                                                                                                                                                                                                                                                           |                   |         |      |       |  |  |                   |  |  |          |      |       |    |      |       |    |            |           |           |         |             |               |         |            |           |            |         |             |               |         |
|                                                         | Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied. |            |                                                                                                                                                            | It is sufficient.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                   |         |      |       |  |  |                   |  |  |          |      |       |    |      |       |    |            |           |           |         |             |               |         |            |           |            |         |             |               |         |
| Orientation of data in relation to geological structure | Whether sample compositing has been applied.                                                                                                                                                                                 |            |                                                                                                                                                            | Drill hole data has been composited downhole to 1m prior to the geostatistical analysis, continuity modelling and grade estimation process. The compositing has been run within the respective mineralisation domains using these as hard boundaries.                                                                                                                                                                                                                                                                                                                        |                   |         |      |       |  |  |                   |  |  |          |      |       |    |      |       |    |            |           |           |         |             |               |         |            |           |            |         |             |               |         |
|                                                         | Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.                                                                   |            |                                                                                                                                                            | Exploration drilling has generally been drilled towards the east at -60 to intersect the mineralised zones, with a couple of holes drilled in different orientations. Grade control drilling was either drilled -60 to the east or vertical depending on the program (later drilled vertically) These orientations are acceptable.                                                                                                                                                                                                                                           |                   |         |      |       |  |  |                   |  |  |          |      |       |    |      |       |    |            |           |           |         |             |               |         |            |           |            |         |             |               |         |
|                                                         | If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.                   |            |                                                                                                                                                            | All drilling from surface has been drilled as close to perpendicular to the predicted orientation of stratigraphy as possible. This has reduced the risk of introducing a sampling bias as far as possible. No orientation-based sampling bias has been identified in the data at this point.                                                                                                                                                                                                                                                                                |                   |         |      |       |  |  |                   |  |  |          |      |       |    |      |       |    |            |           |           |         |             |               |         |            |           |            |         |             |               |         |
| Sample security                                         | The measures taken to ensure sample security.                                                                                                                                                                                |            |                                                                                                                                                            | The sample security of the historic drilling in unknown but is expected to have been acceptable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                   |         |      |       |  |  |                   |  |  |          |      |       |    |      |       |    |            |           |           |         |             |               |         |            |           |            |         |             |               |         |
| Audits or reviews                                       | The results of any audits or reviews of sampling techniques and data.                                                                                                                                                        |            |                                                                                                                                                            | A review of all available information on sampling and procedures used from annual reports has been reviewed in converting this Mineral Resource. Multiple historic audits have been complete by companies assessing the project.                                                                                                                                                                                                                                                                                                                                             |                   |         |      |       |  |  |                   |  |  |          |      |       |    |      |       |    |            |           |           |         |             |               |         |            |           |            |         |             |               |         |

## Annual Mineral Resource and Ore Reserve Statement

| Section 2: Reporting of Exploration Results |                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                                             | The security of the tenure held at the time of reporting along with any known impediments to obtaining a licence to operate in the area.                                                                                                                                     | No known impediment to obtaining a licence to operate exists and the tenements are in good standing.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Exploration done by other parties           | Acknowledgment and appraisal of exploration by other parties.                                                                                                                                                                                                                | <p>The bulk of early drilling at Trojan was completed by Mt Martin Gold Mines in 1987-1993 by RC and RAB drilling. Upon a merger with Titan, RC and diamond drilling continued to define the Trojan deposit until 1998, with drill spacing of ~25m by 25m. Newcrest had an option over the tenement in 1998 and completed confirmatory drilling – confirming the drilling data was acceptable quality with 15 follow-up holes, before New Hampton Goldfields purchased the project in 1999.</p> <p>New Hampton Goldfields completed extensive RC, diamond, and grade control drilling over the project, and this drilling forms the bulk of the data used for the Mineral Resource Estimate. Post mining by New Hampton, small RC programs have been completed by a number of owners including Metals X (Westgold) and Overland Resources.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Geology                                     | Deposit type, geological setting and style of mineralisation.                                                                                                                                                                                                                | <p>Trojan is located on the eastern limb of the south plunging Bulong Anticline, in the Norseman-Wiluna Greenstone Belt. The geology of the limbs is dominated by mafic and ultramafic volcanics and intercalated sediments intruded by dolerite sills. In the core of the anticline, felsic and mafic volcanics and sediments are intruded by granitoids.</p> <p>The Trojan deposit is hosted a multiphase porphyritic granite complex, with the southernmost part of the deposit characterised by interfingering basalts and granites. Two small mafic to ultramafic dykes, up to 2m wide, crosscut the Trojan pit. Trojan is situated between a jog in the Widgiemooltha Supersuite Proterozoic Dyke that crosscuts the geology to the north and the south of the Trojan pit. There is an apparent sinistral movement across the dyke in the north, offsetting mineralisation. A Tertiary palaeochannel ranging from 500m to 1km wide crosscuts the tenement parallel to the dolerite dyke at the southern end of Trojan. A smaller palaeochannel exists over the southern end of the pit. The southernmost part of the Trojan deposit is characterised by interfingering basalts and granites.</p> <p>Mineralisation at Trojan is associated with a NNE trending brittle shear containing multiple sub-parallel lodes dipping 60° west and hosted by granites (quartz syenite), porphyry (of slightly more mafic composition than the granite) and in the extreme southern portion inter-fingered basalt and granite. The Main Lode is up to 25m wide in the centre of the current pit, and comprises a high grade core surrounded by a low grade halo. Where the inter-fingered basalt and granite occurs in the south, the Main lode splits into three distinct narrow mineralised zones. Where the lodes are present in the basalt host rock, their thickness decreases to 2-5m wide.</p> <p>Alteration is characterised by distinctive pink to red haematite staining, quartz veining, silica flooding and pyrite. The pyrite occurs as disseminated crystals and indiscrete fine grained stockworks within the lodes. The haematite is broadly associated with a moderate grade mineralisation zone, but the best indicator of significant mineralisation is silica flooding with fine grained disseminated pyrite. There is also a pervasive potassic alteration of the granite, which has a similar appearance to the haematite staining, but is not necessarily related to gold mineralisation. There is also usually quartz veining in or around the high-grade intersections.</p> <p>Supergene mineralisation is developed over the southern part of the deposit at about 35m below surface, on the oxidised/transition contact. This is to a large extent associated with a basalt precursor. Original lode structures influence higher-grade gold values within the supergene blanket. These are evident as broad quartz lodes or WNW foliated weathered basalt. No supergene enrichment below the small palaeochannel is observed.</p> |
| Drill hole information                      | A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:                                                                                                      | All the drill hole data was used directly or indirectly for the preparation of the resource estimates described in the resource report. Exclusion of the drill information will not detract from the understanding of the report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Annual Mineral Resource and Ore Reserve Statement

| Section 2: Reporting of Exploration Results                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                      |

| Criteria                                                         | JORC Code Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Commentary                                                                                                                                                                                                                           |
|                                                                  | <ul style="list-style-type: none"> <li>easting and northing of the drill hole collar;</li> <li>elevation or Reduced Level ("RL") (elevation above sea level in metres) of the drill hole collar;</li> <li>dip and azimuth of the hole;</li> <li>down hole length and interception depth;</li> <li>hole length; and</li> <li>if the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li> </ul> |                                                                                                                                                                                                                                      |
| Data aggregation methods                                         | In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (e.g., cutting of high grades) and cut-off grades are usually Material and should be stated.                                                                                                                                                                                                                                                                                                                                                                                | No exploration results reported within this announcement                                                                                                                                                                             |
|                                                                  | Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low-grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.                                                                                                                                                                                                                                                                                                                                 | No exploration results reported within this announcement                                                                                                                                                                             |
|                                                                  | The assumptions used for any reporting of metal equivalent values should be clearly stated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Not applicable, as no metal equivalent values have been reported.                                                                                                                                                                    |
| Relationship between mineralisation widths and intercept lengths | <p>These relationships are particularly important in the reporting of Exploration Results.</p> <p>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</p> <p>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (e.g. 'down hole length, true width not known').</p>                                                                                                                                                                                     | No exploration results reported within this announcement                                                                                                                                                                             |
| Diagrams                                                         | Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported. These should include but not be limited to a plan view of drill hole collar locations and appropriate sectional views.                                                                                                                                                                                                                                                                                                                      | Appropriate diagrams were released at time of Resource announcement. Refer to the relevant Resource Announcement listed in Notes on Resources under Gold Resource Table of this announcement.                                        |
| Balanced reporting                                               | <p>Where comprehensive reporting of all Exploration.</p> <p>Results are not practicable, representative reporting of both low and high-grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</p>                                                                                                                                                                                                                                                                                                                                              | No exploration results reported within this announcement                                                                                                                                                                             |
| Other substantive exploration data                               | Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.                                                                                                                                                                                                  | Geophysical surveys including aeromagnetic surveys have been carried out by previous owners to highlight and interpret prospective structures in the project area. No geophysics was used in the production of the Mineral Resource. |
| Further work                                                     | <p>The nature and scale of planned further work (e.g., tests for lateral extensions or depth extensions or large-scale step-out drilling).</p> <p>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</p>                                                                                                                                                                                                                                | Black Cat plans to conduct an exploration program to confirm the current interpretation and target extensions to the currently modelled mineralisation.                                                                              |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Geological interpretation</b>                                                                                                                      | Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.<br><br>Nature of the data used and of any assumptions made.<br><br>The effect, if any, of alternative interpretations on Mineral Resource estimation.<br><br>The use of geology in guiding and controlling Mineral Resource estimation.<br><br>The factors affecting continuity both of grade and geology.                            | Gold mineralised drill hole intercepts were geologically interpreted into a consistent sequence of 12 sub-parallel, shallowly east dipping, fairly close named layer intervals. 4 separate horizontal domains interpreted to represent the shallow supergene mineralisation predominantly to the south.<br><br>Gold mineralisation was generally differentiated from nonmineralized material.<br><br>Six internal high grade sub-domains were generated using indicator interpolants within Leapfrog Geo where considered necessary. Lower cutoffs were nominally applied between 0.5 g/t to 0.75 g/t for higher grade zones. Internal wireframes were limited to approximately 200 to 400 m3 where applicable, with excluded zones being captured in the lower grade shells.<br><br>The intervals of each layer were correlated from section to section and identified by estimation name. The interpretation was based on a system with an average strike direction of 030° and a 65° dip towards 320°.<br><br>No alternate interpretations were considered as the model developed is considered to represent the best fit for the current geological understanding.<br><br>It is the opinion of the Competent Person that there is sufficient information available from the drilling to build a reliable geological interpretation that has appropriate confidence for the classification of the mineral resource.<br><br>The resource categories assigned to the model directly reflect the confidence of the geological interpretation that is built using local, structural, mineral, and alteration geology obtained from geophysics, logging, drilling results and mapping.<br><br>The geological interpretation of Trojan has considered all available geological information. RC and Diamond drilling was used during interpretation. |
| <b>Dimensions</b>                                                                                                                                     | The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource.                                                                                                                                                                                                                                                | The Trojan Resource area extends over a strike length of 990m (from 9,500mN to 10,460mN) and includes the vertical extent of 215m from 375mRL to 160mRL. The area includes the material below the Trojan open pit. The historically reported lodes to the North (Echo and November) have been excluded as they are mostly hosted in the EL 41 outside of the tenement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Estimation and modelling techniques</b>                                                                                                            | The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.<br><br>The availability of check estimates, previous estimates and/or mine production | Estimation of gold grade has been completed using Ordinary Kriging (OK) in all domains in Leapfrog Edge software.<br><br>The lode wireframes have been used to define the domain codes used for estimation. The drillholes have been flagged with the domain code and composited using the domain code to segregate the data. Hard boundaries have been used at all domain boundaries for the grade estimations except for a fourth pass for the low-grade domains.<br><br>Compositing has been undertaken in Leapfrog to 1m with a merge tolerance of 0.3m with the residual distributed equally.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                                                                                                                                                       | records and whether the Mineral Resource estimate takes appropriate account of such data.                                                                                                                           | <p>Six of the primary domains were deemed appropriate for additional higher grade internal mineralisation resulting on 22 separate estimation domains.</p> <p>Variography has been determined within Supervisor v9.2 software on domains using top-cut grade values where required. Where there is insufficient data to generate meaningful variograms, variograms have been grouped or borrowed from other similar domains.</p> <p>The drillhole data spacing ranges from less than 10 m spacing to greater than to 50 m.</p> <p>The block model parent block size is 10.0 m (X) by 20.0 m (Y) by 5 m (Z) and sub-blocks down to 1.25 m (X) by 2.5 m (Y) by 1.25 m (Z), with the sub-blocks estimated at the scale of the parent block. The block size is considered appropriate for the drillhole spacing throughout the deposit.</p> <p>Grade estimation has been completed in four estimation passes with the requirements for filling blocks in each pass summarised as:</p> <ul style="list-style-type: none"> <li>Pass 1 estimations have been undertaken using a minimum of 12 and a maximum of 20 composites into a search ellipsoid with dimensions equal to one half of the variogram of the most continuous domain within the deposit Bulletin and Lennon deposits. Rotations have been applied on a domain by domain basis taken from the wireframe orientation and variogram.</li> <li>Pass 2 estimations have been undertaken using a minimum of 6 and a maximum of 20 composites into a search ellipsoid with dimensions equal to twice the first pass.</li> <li>Pass 3 estimations have been undertaken using a minimum of 4 and a maximum of 10 composites into a search ellipsoid equal to the twice the second pass.</li> <li>Pass 4 estimations have been undertaken using a minimum of 1 and a maximum of 10 composites into a search ellipsoid equal to the five times the first pass to infill the model.</li> <li>Variable search orientations were applied to all domain estimators based on the Trojan interpretation.</li> </ul> <p>The Mineral Resource estimate has been validated using visual validation tools, mean grade comparisons between the block model and composite grade means, and swath plots comparing the composite grades and block model grades by Northing, Easting and RL</p> <p>Gold grade was estimated using Leapfrog Edge software and was completed using ordinary kriging. It was considered that a more robust geological model with smoother and more continuous mineralised lodes will reduce the effects of higher CV. Estimation was carried out on the parent cell.</p> <p>Variograms were generated for all domains within Supervisor where possible. Where variography was considered unreliable, similar geological zones were grouped, or variography was borrowed from similar domains.</p> <p>Search ellipse dimensions and orientation reflect the parameters derived from the variography and geological analysis.</p> <p>Block sizes were selected based on drill spacing and the thickness of the mineralised veins at 10m (east) by 20m (north) by 5m (z). Sub blocking down to 1.25/2.5/1.25 to honour estimation domain volumes was utilised.</p> <p>Average drill spacing ranges from 3.5m x 3.5m in the grade controlled portion, down to 50m x 50m at mineralisation depths and extents.</p> |

| <b>Cut-off parameters</b>                                                                                                                             | <i>The basis of the adopted cut-off grade(s) or quality parameters applied.</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | The indicative cut-off grade of 0.35 g/t Au for the Mineral Resource estimation is determined by the assumption that mining Trojan will be mid-sized open pit cutback operation to approximately 200m below surface.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Mining factors or assumptions</b>                                                                                                                  | <i>Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.</i>                                                                                                                           | The assumption has been made that with the geometry and shallow nature of the mineralisation, mining is likely to be undertaken as an open pit technique.<br><br>No minimum width is applied to the resource. Minimum widths are assessed and applied using Whittle and Mining Shape Optimiser software during the Reserve estimation process.<br><br>It is assumed that planned dilution is factored into the process at the stage of Reserve estimation and stope design planning.<br><br>For the assumption of reasonable prospect of mining the current mining and processing costs at Kalgoorlie East were used for the generation of an optimisation shell; |
| <b>Metallurgical factors or assumptions</b>                                                                                                           | <i>The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.</i>                                                                                                                                                       | It is assumed the material will be trucked and processed at Black Cat's Lakewood mill. Recovery factors are assigned based on lab test work, and historical processing performance.<br><br>No metallurgical assumptions have been built or applied to the Resource model.                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Environmental factors or assumptions</b>                                                                                                           | <i>Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.</i> | A conventional storage facility is used for the process plant tailings.<br><br>Waste rock is to be stored in a traditional waste rock landform 'waste dump'. There is no evidence from previous mining to indicate the presence of deleterious elements within the Trojan deposit.                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Bulk density</b>                                                                                                                                   | <i>Whether assumed or determined. If assumed, the basis for the assumptions. If</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Bulk density is assigned based on regolith. Values of 1.70, 2.40 and 2.70 t/m <sup>3</sup> are used for oxide, transitional and fresh waste rock                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

|                                                | Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.                                                                                                                                                                                                                                                                                                 | Recent RC and diamond drilling undertaken by Black Cat provides high quality representative samples that are carried out to industry standard and include QAQC standards. All samples are weighed in the laboratory. Historical drilling and sampling are assumed as industry standard quality.                                                                                                                                                                                                                                    |
|                                                | Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1m samples from which 3kg was pulverised to produce a 30g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. | Black Cat's RC drilling is sampled into 1m intervals via a cone splitter on the rig producing a representative sample of approximately 3kg. Samples are selected to weigh less than 3kg to ensure total sample inclusion at the pulverisation stage.<br><br>Black Cat's diamond drilling is sampled based off lithological contacts to a maximum sample length of 1m. Core is cut and half or quarter core samples taken in a consistent manner.<br><br>Historical drilling and sampling are assumed as industry standard quality. |

| Sub-sampling techniques and sample preparation | If core, whether cut or sawn and whether quarter, half or all core taken.                                                                                                                                                                                                                                                                                                                                                                     | Diamond core was cut and either half or quarter core taken for assay, depending on metallurgical sampling needs.                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                                                | If non-core, whether riffled, tube sampled, rotary split, etc and whether sampled wet or dry.                                                                                                                                                                                                                                                                                                                                                 | All Black Cat's RC sampling to date have been cone split to 1m increments on the rig. The vast majority of sampling has been dry. Where wet samples have been encountered, the hole is conditioned, and splitter cleaned to prevent downhole contamination.                                                                                                                                                                                                                                                                        |
|                                                | For all sample types, the nature, quality and appropriateness of the sample preparation technique.                                                                                                                                                                                                                                                                                                                                            | The laboratory preparation of samples adheres to industry best practice. It is conducted by a commercial laboratory and involves oven drying, coarse crushing then total grinding to a size of 90% passing 75µm. Historic preparation of samples is unknown but assumed as industry standard.                                                                                                                                                                                                                                      |
|                                                | Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.                                                                                                                                                                                                                                                                                                                                         | All subsampling activities are carried out by commercial laboratory and are considered to be satisfactory.                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Annual Mineral Resource and Ore Reserve Statement

| Section 1: Sampling Techniques and Data                 |                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criteria                                                | JORC Code Explanation                                                                                                                                                                                                            | Commentary                                                                                                                                                                                                                                                                                                                                                                                             |
|                                                         | Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second half sampling.                                                         | Black Cat's RC field duplicate samples are carried out at a rate of 1:50 and are sampled directly from the on-board splitter on the rig. These are submitted for the same assay process as the original samples and the laboratory are unaware of such submissions. Nature of historic procedures is unknown.                                                                                          |
|                                                         | Whether sample sizes are appropriate to the grain size of the material being sampled.                                                                                                                                            | Sample sizes of 3kg are considered to be appropriate given the grain size (90% passing 75µm) of the material sampled.                                                                                                                                                                                                                                                                                  |
|                                                         | The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.                                                                                 | Samples are analysed by an external laboratory using a 40g fire assay with AAS finish. This method is considered suitable for determining gold concentrations in rock and is a total digest method.                                                                                                                                                                                                    |
| Quality of assay data and laboratory tests              | For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. | No geophysical tools were used in this Myhree Resource update.                                                                                                                                                                                                                                                                                                                                         |
|                                                         | Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.                     | Black Cat drilling adhered to strict QAQC protocols involving weighing of samples, collection of field duplicates and insertion of certified reference material (blanks and standards). QAQC data are checked against reference limits in the SQL database on import.                                                                                                                                  |
|                                                         |                                                                                                                                                                                                                                  | The laboratory performs a number of internal processes including repeats, standards and blanks. Analysis of this data displayed acceptable precision and accuracy. Historic QAQC procedures are unknown but assumed to be industry standard.                                                                                                                                                           |
| Verification of sampling and assaying                   | The verification of significant intersections by either independent or alternative company personnel.                                                                                                                            | Black Cat's significant intercepts are verified by database, geological and corporate staff.                                                                                                                                                                                                                                                                                                           |
|                                                         | The use of twinned holes.                                                                                                                                                                                                        | Diamond twinning of RC holes for metallurgical testing have been completed. These have been compared and there is acceptable duplication of grades, mineralisation widths and locations.                                                                                                                                                                                                               |
|                                                         | Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.                                                                                                       | Logging is completed in the field on a table before being uploaded into an SQL database. Assay files are uploaded directly from the lab into the database. The database is managed by a third party.                                                                                                                                                                                                   |
| Location of data points                                 | Discuss any adjustment to assay data.                                                                                                                                                                                            | No adjustments have been made to the assay data.                                                                                                                                                                                                                                                                                                                                                       |
|                                                         | Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.                                                      | Black Cat's drilling is marked out using a handheld GPS prior to drilling. Once complete, the hole collars are picked up by an external contractor using RTK GPS. Downhole surveys are conducted by the drilling contractor at the end of each hole using a down hole north seeking gyro.                                                                                                              |
|                                                         | Specification of the grid system used.                                                                                                                                                                                           | Black Cat uses the grid system GDA 1994 MGA Zone 51. Previous data in grid systems AGD 1966 AMG Zone 51 and AGD 1984 AMG Zone 51 have been converted to MGA 94 Zone 51.                                                                                                                                                                                                                                |
| Data spacing and distribution                           | Quality and adequacy of topographic control.                                                                                                                                                                                     | Topography has been defined by an aerial drone survey, corrected to known points on the ground. All collars are RTK GPS and verified against this topography.                                                                                                                                                                                                                                          |
|                                                         | Data spacing for reporting of Exploration Results.                                                                                                                                                                               | The nominal spacing is 25m (northing) by 30m (easting).                                                                                                                                                                                                                                                                                                                                                |
|                                                         | Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.     | It is sufficient.                                                                                                                                                                                                                                                                                                                                                                                      |
| Orientation of data in relation to geological structure | Whether sample compositing has been applied.                                                                                                                                                                                     | Drill hole data has been composited downhole to 1m prior to the geostatistical analysis, continuity modelling and grade estimation process. The compositing has been run within the respective mineralisation domains using these as hard boundaries with a variable sample length method, which keeps the sample intervals as close to a set length (1m) as possible, in this case with no residuals. |
|                                                         | Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.                                                                       | The deposit is drilled towards grid east at -60 to intersect the mineralised zones at a close to perpendicular relationship for the bulk of the deposit.                                                                                                                                                                                                                                               |
|                                                         | If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.                       | All drilling from surface has been drilled as close to perpendicular to the predicted orientation of stratigraphy as possible. This has reduced the risk of introducing a sampling bias as far as possible. No orientation-based sampling bias has been identified in the data at this point.                                                                                                          |
| Sample security                                         | The measures taken to ensure sample security.                                                                                                                                                                                    | Black Cat's samples prepared on site by Black Cat's geological staff. Samples are selected, collected into tied calico bags and delivered to the laboratory by staff or contractors directly and there are no concerns with sample security.                                                                                                                                                           |

## Annual Mineral Resource and Ore Reserve Statement

| Section 1: Sampling Techniques and Data |                                                                       |                                                                 |

| Criteria                                                                                                                                              | JORC Code Explanation                                                                                                                                                                                                                   | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Database integrity</b>                                                                                                                             | Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.<br><br>Data validation procedures used. | Black Cat's geological data is stored in SQL server databases. The SQL databases are hosted centrally and managed by an external consultant. User access to the database is regulated by specific user permissions and validation checks to ensure data is valid. Acquire software has been implemented as a front-end interface to manage the geological database.<br><br>Existing protocols maximize data functionality and quality whilst minimizing the likelihood of error introduction at primary data collection points and subsequent database upload, storage and retrieval points. Data templates with lookup tables and fixed formatting have been used for collecting primary data on field laptops. The software has validation routines and data is subsequently imported into a secure central database. |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Rock types, mineral, alteration and veining from RC chips were all used to define the mineralised domains and regolith surfaces. Interpreted shears and faults were obtained from SAM surveys, RC chips, and diamond core logging to further constrain the domaining.</p> <p>The geological wireframes defining the mineralised zones are considered robust. Alternative interpretations were explored and did not result in material change of grade or contained metal. Grade shells were modelled in Leapfrog Geo using 0.5 g/t Au as the mineralised cut-off. Additional high-grade shells were modelled in the fresh rock with a cut-off of 1.6 g/t Au. Cut-offs were selected based off observed spatial continuity of grades and geostatistical analysis (primarily log probability plot).</p> <p>The wireframed domains are used as hard boundaries during the mineral resource estimation. They are constructed using all available geological information (as stated above) and terminate along known structures. Mineralisation styles, geological distinctiveness and grade distributions (used to assess any potential populations mixing) are all assessed to ensure effective and accurate estimation of the domains.</p> <p>Mineralisation at the Myhree deposit is comprised of altered ultramafic host rock that dips to the west and strikes to the NNE.</p> |

The mineralisation widths vary from approx. 12m to 1m with approx. 3m average width.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Estimation and modelling techniques</b>                                                                                                            | <p>The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</p> <p>The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</p> <p>The assumptions made regarding recovery of by-products.</p> <p>Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).</p> <p>In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.</p> | <p>Gold grade was estimated using Leapfrog EDGE using ordinary kriging. It was considered that a more robust geological model with smoother and more continuous mineralised lodes will reduce the effects of higher CV. Estimation was carried out on the parent cell.</p> <p>Variograms were generated using composited drill data in Leapfrog EDGE software.</p> <p>Search ellipse dimensions and orientation reflect the parameters derived from the variography analysis and the Kriging Neighbourhood Analysis.</p> <p>Only Au grade was estimated. No other elements were estimated.</p> <p>No deleterious elements were estimated or assumed. Environmental testing indicates no deleterious elements in the deposit.</p> <p>Block sizes were selected based on drill spacing and the thickness of the mineralised veins at 5m (east) by 10m (north) by 5m (z). Sub blocking down to 0.625/1.25/1.25 to honour estimation domain volumes was utilised.</p> <p>Average drill spacing was 25m x 25m in the majority of the deposit, and down to 50m x 100m at mineralisation depths and extents.</p> <p>No selective mining units were assumed in the resource estimate.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

|                                                                                                                                                       | <p>Any assumptions behind modelling of selective mining units.</p> <p>Any assumptions about correlation between variables.</p> <p>Description of how the geological interpretation was used to control the resource estimates.</p> <p>Discussion of basis for using or not using grade cutting or capping.</p> <p>The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.</p>                                                                                                                                                                                                    | <p>Blocks were generated within the mineralised surfaces that defined each mineralised zone. Blocks within these zones were estimated using data that was contained within the same zone. Hard boundaries were used for all domains.</p> <p>Top cuts were applied to the data to control the effects of extreme high-grade Au values that were considered not representative. The effect of the top cuts was reviewed with respect to the resulting Population distribution and fragmentation, mean and CV values.</p> <p>The model was validated by comparing statistics of the estimated blocks against the composited sample data; visual examination of the block grades versus assay data in section; swathe plots; and reconciliation against previous production and estimates.</p> |
| <b>Moisture</b>                                                                                                                                       | Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | All estimations are carried out on a 'dry' basis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Cut-off parameters</b>                                                                                                                             | The basis of the adopted cut-off grade(s) or quality parameters applied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | The indicative cut-off grade of 0.7 g/t Au for the Mineral Resource estimation is determined by the assumption that mining Myhree will be a small to mid-sized open pit operation. Material below base of pit RL (255mRL) has been reported at 2.0 g/t Au under the assumption of underground mining operations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Mining factors or assumptions</b>                                                                                                                  | Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.                                                                                                                           | <p>No minimum width is applied to the Resource. Minimum widths are assessed and applied using Whittle or Mining Shape Optimiser software during the Reserve process.</p> <p>It is assumed that planned dilution is factored into the process at the stage of Reserve and stope design planning.</p> <p>The open pit depth is applied to all material above the base of the \$AUD2,500 pit shell optimised with current industry rates.</p>                                                                                                                                                                                                                                                                                                                                                 |
| <b>Metallurgical factors or assumptions</b>                                                                                                           | The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.                                                                                                                                                       | <p>Assumed the material will be trucked and processed at Black Cat's own mill. Recovery factors are assigned based on lab test work, and on-going experience.</p> <p>No metallurgical assumptions have been built or applied to the Resource model.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Environmental factors or assumptions</b>                                                                                                           | Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made. | <p>A conventional storage facility is used for the process plant tailings.</p> <p>Waste rock is to be stored in a traditional waste rock landform 'waste dump'. Environmental studies indicate no deleterious elements within the Myhree deposit.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Bulk density</b>                                                                                                                                   | <p>Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.</p> <p>The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.</p> <p>Discuss assumptions for bulk density estimates used in the evaluation process</p>                                                                                                                              | <p>Bulk density is assigned based on regolith. Values of 1.80, 2.20 and 2.80 t/m<sup>3</sup> are used for oxide, transitional and fresh waste rock respectively.</p> <p>Bulk density values were taken from samples that were calculated using the Archimedes (water immersion) technique from drill core. Similar geological deposits in the Bulong geological area were also considered. A truncated average (extreme values removed) was calculated to determine density values that would apply.</p> <p>Density values are allocated uniformly to each regolith type.</p>                                                                                                                                                                                                              |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                |

| Discussion of relative accuracy/ confidence                                                                                                           | Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.<br><br>The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.<br><br>These statements of relative accuracy and confidence of the estimate should be compared with production data, where available. | The geological interpretation, estimation parameters and validation of the Resource model were peer reviewed by Black Cat staff.                                                                                                                                                                               |
|                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | No external reviews of the Resource estimate had been carried out at the time of writing.                                                                                                                                                                                                                      |

| Criteria                                | JORC Code Explanation                                                                                                                                                                                                                                                                                                        | Commentary                                                                                                                                                                                                                |
| Sampling techniques                     | Nature and quality of sampling (eg cut channels, random chips, or specific specialised industry standard measurement tools appropriate to the minerals under investigation, such as down hole gamma sondes, or handheld XRF instruments, etc). These examples should not be taken as limiting the broad meaning of sampling. | Black Cat has undertaken sampling activities at Boundary via reverse circulation and diamond drilling. Historic RC, RAB and AC drilling also exists in the area with the majority drilled by General Gold.                |
|                                         | Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.                                                                                                                                                                                | Recent reverse circulation drilling undertaken by Black Cat provides high quality representative samples that are carried out to industry standard and include QAQC standards. All samples are weighed in the laboratory. |
|                                         |                                                                                                                                                                                                                                                                                                                              | Historical drilling and sampling are assumed as industry standard quality. This has been checked via database audits and drilling.                                                                                        |

## Annual Mineral Resource and Ore Reserve Statement

| Section 1: Sampling Techniques and Data               |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Criteria                                              | JORC Code Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|                                                       | <p>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1m samples from which 3kg was pulverised to produce a 30g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems.</p> <p>Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</p> | <p>Black Cat's RC drilling is sampled into 1m intervals via a cone splitter on the rig producing a representative sample of approximately 3kg. Samples are selected to weigh less than 3kg to ensure total sample inclusion at the pulverisation stage.</p> <p>Black Cat's diamond drilling is sampled based off lithological contacts to a maximum sample length of 1m. Core is cut and quarter core samples taken in a consistent manner always taking the same portion of core to the right of the orientation line looking downhole.</p> <p>Historical drilling and sampling by General Gold are assumed as industry standard quality. Historic reports indicate that metre samples were collected in green bags and 4m spear composites were taken. If anomalous gold was reported, sampling at 1m intervals was then completed.</p> <p>All Black Cat samples are crushed, dried and pulverised to a nominal 90% passing 75µm to produce a 40g or 50g sub sample for analysis by FA/AAS.</p> <p>Historical assays for General Gold were completed by Multilab (Analabs) in Perth and are assumed as industry standard.</p> |
| <b>Drilling techniques</b>                            | <p>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</p>                                                                                                                                                                                                                                                                                     | <p>Reverse circulation drilling was completed using a face sampling percussion hammer. The reverse circulation bit size was 123mm to 143mm diameter.</p> <p>Diamond drilling was completed using HQ size.</p> <p>Historical reverse circulation drilling size is unknown.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Drill sample recovery</b>                          | Method of recording and assessing core and chip sample recoveries and results assessed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>RC samples are checked both visually and by hand-scales in the field. Recoveries for recent RC drilling have been recorded based on laboratory weights. It is unknown if historic recoveries were recorded.</p> <p>Historic RC is unknown.</p> <p>Diamond core is geologically and geotechnically logged with core loss noted during this process.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|                                                       | Measures taken to maximise sample recovery and ensure representative nature of the samples.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Sample recovery and representivity were maintained through industry standard maintenance of the cone splitter and verified through the use of duplicate samples. Historic reverse circulation is unknown.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

|                                            | Quality control procedures adopted for all sub-sampling stages to maximise representivity of samples.                                                                                                                            | All subsampling activities are carried out by commercial laboratory and are considered to be satisfactory.                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                                            | Measures taken to ensure that the sampling is representative of the in situ material collected, including for instance results for field duplicate/second half sampling.                                                         | Black Cat's RC field duplicate samples are carried out at a rate of 1:50 and are sampled directly from the on-board splitter on the rig. These are submitted for the same assay process as the original samples and the laboratory are unaware of such submissions.<br><br>Historic duplicate sampling is unknown.                                                                                                                                                                                                          |
|                                            | Whether sample sizes are appropriate to the grain size of the material being sampled.                                                                                                                                            | Sample sizes of 3kg are considered to be appropriate given the grain size (90% passing 75µm) of the material sampled.                                                                                                                                                                                                                                                                                                                                                                                                       |
| Quality of assay data and laboratory tests | The nature, quality and appropriateness of the assaying and laboratory procedures used and whether the technique is considered partial or total.                                                                                 | Samples are analysed by an external laboratory using a 40g fire assay with AAS finish. This method is considered suitable for determining gold concentrations in rock and is a total digest method.<br><br>Historic sampling by General Gold was completed as 20g AAS for 4m composites and 50g AAS for 1m resamples.                                                                                                                                                                                                       |
|                                            | For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. | No geophysical tools were used in this Mineral Resource.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                                            | Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.                     | Black Cat's drilling adhered to strict QAQC protocols involving weighing of samples, collection of field duplicates and insertion of certified reference material (blanks and standards). QAQC data are checked against reference limits in the SQL database on import.<br><br>The laboratory performs a number of internal processes including repeats, standards and blanks. Analysis of this data displayed acceptable precision and accuracy. Historic QAQC procedures are unknown but assumed to be industry standard. |
| Verification of sampling and assaying      | The verification of significant intersections by either independent or alternative company personnel.                                                                                                                            | Black Cat's significant intercepts are verified by database, geological and corporate staff.                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                                            | The use of twinned holes.                                                                                                                                                                                                        | Black Cat will use twinned holes to assist in verification of historic results from time to time. Black Cat has drilled 13 twin holes adjacent to 1990's drill holes at Boundary.                                                                                                                                                                                                                                                                                                                                           |
|                                            | Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.                                                                                                       | All primary data related to logging is directly entered to Excel templates and sampling data is captured on paper logs first prior to digital entry. All paper copies of data have been stored. All data is sent to Perth and stored in the centralised Access database with an SQL backend, managed by a database consultant.                                                                                                                                                                                              |
|                                            | Discuss any adjustment to assay data.                                                                                                                                                                                            | No adjustments or calibrations are made to any assay data, apart from resetting below detection values to half positive detection. First gold assay is utilised for exploration work.                                                                                                                                                                                                                                                                                                                                       |
| Location of data points                    | Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.                                                      | Black Cat's drilling is marked out using a handheld GPS prior to drilling. Once complete, the hole collars are picked up by an external contractor using RTK GPS. Downhole surveys are conducted by the drilling contractor at the end of each hole using a down hole north seeking gyro.<br><br>Historic drilling was surveyed at time of drilling. Where collars could be located, they have been picked up using the RTK GPS.                                                                                            |
|                                            | Specification of the grid system used.                                                                                                                                                                                           | Black Cat uses the grid system GDA 1994 MGA Zone 51. Previous data in grid systems AGD 1966 AMG Zone 51 and AGD 1984 AMG Zone 51 have been converted to MGA 94 Zone 51.                                                                                                                                                                                                                                                                                                                                                     |
|                                            | Quality and adequacy of topographic control.                                                                                                                                                                                     | The topographic surface was compiled using the collar surveys. Approximately 90% of collars at Boundary have been surveyed using RTK GPS and the remainder were surveyed using handheld GPS.                                                                                                                                                                                                                                                                                                                                |
| Data spacing and distribution              | Data spacing for reporting of Exploration Results.                                                                                                                                                                               | The nominal drill hole spacing is 50m (northing) by 30m (easting).                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                            | Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.     | Drill hole spacing is sufficient.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Orientation of data in                     | Whether sample compositing has been applied.                                                                                                                                                                                     | No compositing has been applied to samples other than during the estimation process.                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Annual Mineral Resource and Ore Reserve Statement

| Section 1: Sampling Techniques and Data |                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                               |
|-----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criteria                                | JORC Code Explanation                                                                                                                                                                                             | Commentary                                                                                                                                                                                                                                                                                    |
| <b>relation to geological structure</b> | <i>Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.</i>                                                 | The deposit is drilled towards grid east at -60 to intersect the mineralised zones at a close to perpendicular relationship for the bulk of the deposit.                                                                                                                                      |
|                                         | <i>If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.</i> | All drilling from surface has been drilled as close to perpendicular to the predicted orientation of stratigraphy as possible. This has reduced the risk of introducing a sampling bias as far as possible. No orientation-based sampling bias has been identified in the data at this point. |
| <b>Sample security</b>                  | <i>The measures taken to ensure sample security.</i>                                                                                                                                                              | Black Cat's samples are prepared on site by Black Cat's geological staff. Samples are selected, collected into tied calico bags and delivered to the laboratory by staff or contractors directly and there are no concerns with sample security.                                              |
| <b>Audits or reviews</b>                | <i>The results of any audits or reviews of sampling techniques and data.</i>                                                                                                                                      | Black Cat has recently created appropriate sampling procedures.                                                                                                                                                                                                                               |

| Criteria                                                                                                                                              | JORC Code Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Database integrity</b>                                                                                                                             | <p>Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.</p> <p>Data validation procedures used.</p>                                                                                                                                                                                                       | <p>Black Cat's geological data is stored in SQL server databases. The SQL databases are hosted centrally and managed by Black Cat personnel. User access to the database is regulated by specific user permissions and validation checks to ensure data is valid. Acquire software has been implemented as a front-end interface to manage the geological database.</p> <p>Existing protocols maximize data functionality and quality whilst minimizing the likelihood of error introduction at primary data collection points and subsequent database upload, storage and retrieval points. Data templates with lookup tables and fixed formatting have been used for collecting primary data on field laptops. The software has validation routines and data is subsequently imported into a secure central database.</p> <p>The SQL server database is configured for validation through parent/child table relationships, required fields, logical constraints and referenced library tables. Data that fails these rules on import is rejected or quarantined until it is corrected.</p> <p>The SQL server database is managed by a contract Database Manager who is responsible for all aspects of data entry, validation, development, quality control and specialist queries. There is a standard suite of validation checks for all data.</p>                                                                                                                                                                                                           |
| <b>Site visits</b>                                                                                                                                    | <p>Comment on any site visits undertaken by the Competent Person and the outcome of those visits.</p> <p>If no site visits have been undertaken indicate why this is the case.</p>                                                                                                                                                                                                                                                                   | <p>The Competent Person has undertaken multiple site visits during his role within the company. This has included reverse circulation and diamond logging, observing sampling and logging processes, and mapping.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Geological interpretation</b>                                                                                                                      | <p>Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.</p> <p>Nature of the data used and of any assumptions made.</p> <p>The effect, if any, of alternative interpretations on Mineral Resource estimation.</p> <p>The use of geology in guiding and controlling Mineral Resource estimation.</p> <p>The factors affecting continuity both of grade and geology.</p>                            | <p>The Resource categories assigned to the model directly reflect the confidence of the geological interpretation that is built using local, structural, mineral, and alteration geology obtained from geophysics, logging, drilling results and mapping.</p> <p>The geological interpretation of Boundary has considered all available geological information. Rock types, mineral, alteration and veining from both reverse circulation chips and diamond core were all used to define the mineralised domains and regolith surfaces. Interpreted shears and faults were obtained from SAM surveys, reverse circulation drilling chips, and diamond core logging to further constrain the domaining.</p> <p>The geological wireframes defining the mineralised zones are considered robust. Alternative interpretations were explored and did not materially change grade or contained metal. Grade shells were modelled in Leapfrog Geo using 0.5 g/t as the mineralised cut-off. Cut-offs were selected based off observed spatial continuity of grades and geostatistical analysis (primarily log probability plot).</p> <p>The wireframed domains are used as hard boundaries during the Mineral Resource estimation. They are constructed using all available geological information (as stated above) and terminate along known structures. Mineralisation styles, geological distinctiveness and grade distributions (used to assess any potential populations mixing) are all assessed to ensure effective and accurate estimation of the domains.</p> |
| <b>Dimensions</b>                                                                                                                                     | <p>The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource</p>                                                                                                                                                                                                                                                 | <p>The Boundary resource covers an area of 800m strike; 120m across strike; and 100m down dip and open at depth. |                                                                                                                                                       | <p>records and whether the Mineral Resource estimate takes appropriate account of such data.</p> <p>The assumptions made regarding recovery of by-products.</p> <p>Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).</p> <p>In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.</p> <p>Any assumptions behind modelling of selective mining units.</p> <p>Any assumptions about correlation between variables.</p> <p>Description of how the geological interpretation was used to control the resource estimates.</p> <p>Discussion of basis for using or not using grade cutting or capping.</p> <p>The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.</p> | <p>Only Au grade was estimated. No other elements were estimated.</p> <p>No deleterious elements were estimated or assumed.</p> <p>Block sizes were selected based on drill spacing and the thickness of the mineralised veins at 5m (east) by 10m (north) by 5m (z). Sub blocking down to 0.625/1.25/1.25 to honour estimation domain volumes was utilised.</p> <p>Average drill spacing was 50m x 50m in the majority of the deposit, and down to 20m x 20m in closer spaced drill sections. Resource extents have drill spacing down to 50m by 100m.</p> <p>No selective mining units were assumed in the Resource estimate.</p> <p>Blocks were generated within the mineralised surfaces that defined each mineralised zone. Blocks within these zones were estimated using data that was contained with the same zone. Hard boundaries were used for all domains.</p> <p>Top cuts were applied to the data to control the effects of extreme high-grade Au values that were considered not representative. The effect of the top cuts was reviewed with respect to the resulting population distribution and fragmentation, mean and CV values.</p> <p>The model was validated by comparing statistics of the estimated blocks against the composited sample data; visual examination of the block grades versus assay data in section and swathe plots; and reconciliation against previous production and estimates.</p> |

Material below base of pit RL (310mRL) has been reported at 2.0 g/t Au under the assumption of underground mining operations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Mining factors or assumptions</b>                                                                                                                  | Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.                                                                                                                                                                                                                                                                                                                                                                                 | <p>No minimum width is applied to the Resource. Minimum widths are assessed and applied using Whittle or Mining Shape Optimiser software during the Reserve process.</p> <p>It is assumed that planned dilution is factored into the process at the stage of Reserve and stope design planning.</p> <p>The open pit depth is applied to all material above the base of the \$AUD2,500 pit shell optimised with current industry rates for a satellite operation.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Metallurgical factors or assumptions</b>                                                                                                           | The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.                                                                                                                                                                                                                                                                                                                                                                                                             | <p>Assumed the material will be trucked and processed at Black Cat's own mill. Recovery factors are assigned based on lab test work, and on-going experience.</p> <p>No metallurgical assumptions have been built or applied to the Resource model.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Environmental factors or assumptions</b>                                                                                                           | Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made.                                                                                                                                                                                                                                                       | <p>A conventional storage facility is used for the process plant tailings.</p> <p>Waste rock is to be stored in a traditional waste rock landform 'waste dump'. Due to moderate to high sulphide content and the minimal presence of carbonate alteration the potential for acid content is considered high. A waste rock control strategy is planned to be put in place at the time of any future mining.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in Section 1, and where relevant in Section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| Criteria                                                                                                                                              | JORC Code Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Bulk density</b>                                                                                                                                   | <p>Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.</p> <p>The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.</p> <p>Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.</p>                                                                                                                                                                                                                                                                                                                                                                | <p>Bulk density is assigned based on regolith profile. Values of 1.80, 2.10 and 2.79 t/m<sup>3</sup> are used for oxide, transitional and fresh waste rock respectively.</p> <p>Bulk density values are taken from Myhree where more extensive density work has been completed. Density readings were taken from samples that were calculated using the Archimedes (water immersion) technique from drill core. Similar geological deposits in the Bulong geological area were also considered. A truncated average (extreme values removed) was calculated to determine density values that would apply. Density values are allocated uniformly to each lithological and regolith type.</p>                                                                        |
| <b>Classification</b>                                                                                                                                 | <p>The basis for the classification of the Mineral Resources into varying confidence categories.</p> <p>Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence in continuity of geology and metal values, quality, quantity and distribution of the data).</p> <p>Whether the result appropriately reflects the Competent Person's view of the deposit.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>No Measured Mineral Resources at Boundary.</p> <p>Indicated Mineral Resources is where drill spacing is typically around 25m x 25m.</p> <p>Inferred Mineral Resources are based on limited data support. No development for geological mapping; typically drill spacing greater than 25m x 25m (down to 100m x 50m at Resource extents).</p> <p>Further considerations of Resource classification include; data type and quality (drilling type, drilling orientations, down hole surveys, sampling and assaying methods); geological mapping and understanding; statistical performance including number of samples, slope regression and kriging efficiency.</p> <p>The Mineral Resource estimate appropriately reflects the view of the Competent Person.</p> |
| <b>Audits or reviews</b>                                                                                                                              | The results of any audits or reviews of Mineral Resource estimates                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>The geological interpretation, estimation parameters and validation of the Resource model were peer reviewed by Black Cat staff.</p> <p>No external reviews of the Mineral Resource estimate had been carried out at the time of writing.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Discussion of relative accuracy/ confidence</b>                                                                                                    | <p>Where appropriate a statement of the relative accuracy and confidence level in the Mineral Resource estimate using an approach or procedure deemed appropriate by the Competent Person. For example, the application of statistical or geostatistical procedures to quantify the relative accuracy of the resource within stated confidence limits, or, if such an approach is not deemed appropriate, a qualitative discussion of the factors that could affect the relative accuracy and confidence of the estimate.</p> <p>The statement should specify whether it relates to global or local estimates, and, if local, state the relevant tonnages, which should be relevant to technical and economic evaluation. Documentation should include assumptions made and the procedures used.</p> <p>These statements of relative accuracy and confidence of the estimate should be compared with production data, where available.</p> | <p>The relative accuracy of the Mineral Resource estimate is reflected in the reporting of the Mineral Resource as per the guidelines of the 2012 JORC Code.</p> <p>The statement relates to the global estimates of tonnes and grade above an RL selected from the base of an optimisation pit shell at a 0.7 g/t Au cut-off and 2.0 g/t Au below the pit.</p> <p>No recorded mining has been undertaken at Boundary.</p>                                                                                                                                                                                                                                                                                                                                          |

|                                                       | instruments, etc). These examples should not be taken as limiting the broad meaning of sampling.                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                                       | Include reference to measures taken to ensure sample representivity and the appropriate calibration of any measurement tools or systems used.                                                                                                                                                                                                                                                                                                 | Recent reverse circulation and diamond drilling undertaken by Black Cat provides high quality representative samples that are carried out to industry standard and include QAQC standards. All samples are weighed in the laboratory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|                                                       | Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1m samples from which 3kg was pulverised to produce a 30g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. | Historical drilling and sampling are assumed as industry standard quality. This has been checked via database audits and drilling.<br>Black Cat's RC drilling is sampled into 1m intervals via a cone splitter on the rig producing a representative sample of approximately 3kgs. Samples are selected to weigh less than 3kg to ensure total sample inclusion at the pulverisation stage.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|                                                       | Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.                                                                                                                                                                                                                                                                                                                            | Black Cat's diamond drilling is sampled based off lithological contacts to a maximum sample length of 1m. Core is cut and quarter core samples taken in a consistent manner always taking the same portion of core to the right of the ori line looking downhole.<br>Historical drilling and sampling by General Gold are assumed as industry standard quality. Historic reports indicate that metre samples were collected in green bags and 4m spear composites were taken. If anomalous gold was reported, sampling at 1m intervals was then completed.<br>All Black Cat samples are crushed, dried and pulverised to a nominal 90% passing 75µm to produce a 40g or 50g sub sample for analysis by FA/AAS.<br>Historical assays for General Gold were completed by Multilab (Analabs) in Perth and are assumed as industry standard. |
| <b>Drilling techniques</b>                            | <i>Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).</i>                                                                                                                                                    | RC drilling was completed using a face sampling percussion hammer. The reverse circulation bit size was 123mm to 143mm diameter.<br>Diamond drilling was completed using HQ size.<br>Historical reverse circulation drilling size is unknown.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Drill sample recovery</b>                          | <i>Method of recording and assessing core and chip sample recoveries and results assessed.</i>                                                                                                                                                                                                                                                                                                                                                | RC samples are checked both visually and by hand-scales in the field. Recoveries for recent RC drilling have been recorded based on laboratory weights. It is unknown if historic recoveries were recorded. Historic reverse circulation is unknown.<br>Diamond core is geologically and geotechnically logged with core loss noted during this process.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                                                       | <i>Measures taken to maximise sample recovery and ensure representative nature of the samples.</i>                                                                                                                                                                                                                                                                                                                                            | Sample recovery and representivity were maintained through industry standard maintenance of the cone splitter and verified through the use of duplicate samples. Historic reverse circulation is unknown.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                                                       | <i>Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.</i>                                                                                                                                                                                                                                                                       | There is no known relationship between sample recovery and grade for drilling completed by Black Cat. Any historical relationship is not known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Orientation of data in relation to geological structure | <i>Whether sample compositing has been applied.</i>                                                                                                                                                                                     | Drill hole data has been composited downhole to 1m prior to the geostatistical analysis, continuity modelling and grade estimation process. The compositing has been run within the respective mineralisation domains using these as hard boundaries with a variable sample length method, which keeps the sample intervals as close to a set length (1m) as possible, in this case with no residuals.                                                                                                                      |

## Annual Mineral Resource and Ore Reserve Statement

| Section 1: Sampling Techniques and Data |                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                               |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Criteria                                | JORC Code Explanation                                                                                                                                                                                      | Commentary                                                                                                                                                                                                                                                                                    |
|                                         | Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.                                                 | The deposit is drilled towards grid east at -60 to intersect the mineralised zones at a close to perpendicular relationship for the bulk of the deposit.                                                                                                                                      |
|                                         | If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material. | All drilling from surface has been drilled as close to perpendicular to the predicted orientation of stratigraphy as possible. This has reduced the risk of introducing a sampling bias as far as possible. No orientation-based sampling bias has been identified in the data at this point. |
| Sample security                         | The measures taken to ensure sample security.                                                                                                                                                              | Black Cat's samples are prepared on site by Black Cat's geological staff. Samples are selected, collected into tied calico bags and delivered to the laboratory by staff or contractors directly and there are no concerns with sample security.                                              |
| Audits or reviews                       | The results of any audits or reviews of sampling techniques and data.                                                                                                                                      | Black Cat has recently created appropriate sampling procedures.                                                                                                                                                                                                                               |

| Section 2: Reporting of Exploration Results (Criteria listed in the preceding section also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Project-scale geology consists of granite-greenstone lithologies that were metamorphosed to greenschist facies grade. The Archaean lithologies are cut by Proterozoic dolerite dykes.</p> <p>The style of mineralisation is Archaean orogenic gold.</p> <p>Locally, Trump is associated with a felsic unit hosted within a conglomerate.</p>                                                                                                                                                                                                                                                                                                                                                                                         |
| Drill hole information                                                                                             | <p>A summary of all information material to the understanding of the exploration results including a tabulation of the following information for all Material drill holes:</p> <ul style="list-style-type: none"> <li>– easting and northing of the drill hole collar;</li> <li>– elevation or Reduced Level ("RL") (elevation above sea level in metres) of the drill hole collar;</li> <li>– dip and azimuth of the hole;</li> </ul> | All the drill hole data was used directly or indirectly for the preparation of the resource estimates described in the resource report. Exclusion of the drill information will not detract from the understanding of the report.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Annual Mineral Resource and Ore Reserve Statement

| Section 2: Reporting of Exploration Results (Criteria listed in the preceding section also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                               |

| Criteria                                                                                                           | JORC Code Explanation                                                                                                                                                                                                                                                                                                                                                                            | Commentary                                                                                                                                                                                    |
|                                                                                                                    | <ul style="list-style-type: none"> <li>– down hole length and interception depth;</li> <li>– hole length; and</li> <li>– if the exclusion of this information is justified on the basis that the information is not Material and this exclusion does not detract from the understanding of the report, the Competent Person should clearly explain why this is the case.</li> </ul>              |                                                                                                                                                                                               |
| Data aggregation methods                                                                                           | In reporting Exploration Results, weighting averaging techniques, maximum and/or minimum grade truncations (eg cutting of high-grades) and cut-off grades are usually Material and should be stated.                                                                                                                                                                                             | No exploration results reported within this announcement                                                                                                                                      |
|                                                                                                                    | Where aggregate intercepts incorporate short lengths of high-grade results and longer lengths of low grade results, the procedure used for such aggregation should be stated and some typical examples of such aggregations should be shown in detail.                                                                                                                                           | No exploration results reported within this announcement                                                                                                                                      |
|                                                                                                                    | The assumptions used for any reporting of metal equivalent values should be clearly stated.                                                                                                                                                                                                                                                                                                      | Not applicable, as no metal equivalent values have been reported.                                                                                                                             |
| Relationship between mineralisation widths and intercept lengths                                                   | <p>These relationships are particularly important in the reporting of Exploration Results.</p> <p>If the geometry of the mineralisation with respect to the drill hole angle is known, its nature should be reported.</p> <p>If it is not known and only the down hole lengths are reported, there should be a clear statement to this effect (eg 'down hole length, true width not known').</p> | No exploration results reported within this announcement                                                                                                                                      |
| Diagrams                                                                                                           | Appropriate maps and sections (with scales) and tabulations of intercepts should be included for any significant discovery being reported These should include but not be limited to a plan view of drill hole collar locations and appropriate sectional views.                                                                                                                                 | Appropriate diagrams were released at time of Resource announcement. Refer to the relevant Resource Announcement listed in Notes on Resources under Gold Resource Table of this announcement. |
| Balanced reporting                                                                                                 | <p>Where comprehensive reporting of all Exploration.</p> <p>Results are not practicable, representative reporting of both low and high-grades and/or widths should be practiced to avoid misleading reporting of Exploration Results.</p>                                                                                                                                                        | No exploration results reported within this announcement                                                                                                                                      |
| Other substantive exploration data                                                                                 | Other exploration data, if meaningful and material, should be reported including (but not limited to): geological observations; geophysical survey results; geochemical survey results; bulk samples – size and method of treatment; metallurgical test results; bulk density, groundwater, geotechnical and rock characteristics; potential deleterious or contaminating substances.            | Geophysical surveys including aeromagnetic surveys have been carried out by previous owners to highlight and interpret prospective structures in the project area.                            |
| Further work                                                                                                       | <p>The nature and scale of planned further work (eg tests for lateral extensions or depth extensions or large-scale step-out drilling).</p> <p>Diagrams clearly highlighting the areas of possible extensions, including the main geological interpretations and future drilling areas, provided this information is not commercially sensitive.</p>                                             | At this stage, Black Cat is assessing the potential to expand Trump with further drilling, as well as other nearby deposits, both at depth and along strike to the north and south.           |

## Annual Mineral Resource and Ore Reserve Statement

| Section 2: Reporting of Exploration Results (Criteria listed in the preceding section also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Database integrity</b>                                                                                                                             | <p>Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.</p> <p>Data validation procedures used.</p> | <p>Black Cat geological data is stored in SQL server databases. The SQL databases are hosted centrally and managed by an external consultant. User access to the database is regulated by specific user permissions and validation checks to ensure data is valid. Acquire software has been implemented as a front-end interface to manage the geological database.</p> <p>Existing protocols maximize data functionality and quality whilst minimizing the likelihood of error introduction at primary data collection points and subsequent database upload, storage and retrieval points. Data templates with lookup tables and fixed formatting have been used for collecting primary data on field laptops. The software has validation routines and data is subsequently imported into a secure central database.</p> <p>The SQL server database is configured for validation through parent/child table relationships, required fields, logical constraints and referenced library tables. Data that fails these rules on import is rejected or quarantined until it is corrected.</p> <p>The SQL server database is managed by a contract Database Manager who is responsible for all aspects of data entry, validation,</p> |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Rock types, mineral, alteration and veining from RC chips were all used to define the mineralised domains and regolith surfaces. Interpreted shears and faults were obtained from SAM surveys, RC chips, and diamond core logging to further constrain the domaining.</p> <p>The geological wireframes defining the mineralised zones are considered robust. Alternative interpretations were explored and did not materially change grade or contained metal. Grade shells were modelled in Leapfrog Geo using 0.5 g/t Au as the mineralised cut-off. Cut-offs were selected based off observed spatial continuity of grades and geostatistical analysis (primarily log probability plot).</p> <p>The wireframed domains are used as hard boundaries during the mineral resource estimation. They are constructed using all available geological information (as stated above) and terminate along known structures. Mineralisation styles, geological distinctiveness and grade distributions (used to assess any potential populations mixing) are all assessed to ensure effective and accurate estimation of the domains.</p> <p>Mineralisation at the Strathfield deposit is comprised of altered ultramafic host rock that dips to the west and strikes to the NNE.</p> |
| <b>Dimensions</b>                                                                                                                                     | The extent and variability of the Mineral Resource expressed as length (along strike or otherwise), plan width, and depth below surface to the upper and lower limits of the Mineral Resource                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | The Trump resource covers an area of 1,250m strike; 15m across strike; and 200m down dip and open at depth. The mineralisation widths vary from approx. 15m to 0.5m with approx.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Estimation and modelling techniques</b>                                                                                                            | <p>The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</p> <p>The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</p> <p>The assumptions made regarding recovery of by-products.</p> <p>Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).</p> <p>In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.</p> <p>Any assumptions behind modelling of selective mining units.</p> <p>Any assumptions about correlation between variables.</p> <p>Description of how the geological interpretation was used to control the</p> | <p>Gold grade was estimated using Leapfrog EDGE using ordinary kriging. It was considered that a more robust geological model with smoother and more continuous mineralised lodes will reduce the effects of higher CV. Estimation was carried out on the parent cell.</p> <p>Variograms were generated using composited drill data in Leapfrog EDGE software.</p> <p>Search ellipse dimensions and orientation reflect the parameters derived from the variography analysis and the Kriging Neighbourhood Analysis.</p> <p>Only Au grade was estimated. No other elements were estimated.</p> <p>No deleterious elements were estimated or assumed.</p> <p>Block sizes were selected based on drill spacing and the thickness of the mineralised veins at 5m (east) by 10m (north) by 5m (z). Sub blocking down to 0.625/1.25/1.25 to honour estimation domain volumes was utilised.</p> <p>Average drill line spacing was 50m with 25m along the drill sections with a zone of 25m by 25m in the south and at the optimised pit for Trump North.</p> <p>No selective mining units were assumed in the resource estimate.</p> <p>Blocks were generated within the mineralised surfaces the defined each mineralised zone. Blocks within these zones were estimated using data that was contained with the same zone. Hard boundaries were used for all domains.</p> <p>Top cuts were applied to the data to control the effects of extreme high-grade Au values that were considered not representative.</p>                                                                                                                               |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| Criteria                                                                                                                                              | JORC Code Explanation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Commentary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|                                                                                                                                                       | <p>resource estimates.</p> <p>Discussion of basis for using or not using grade cutting or capping.</p> <p>The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.</p>                                                                                                                                                                                                                                                                                                                                                                                                            | <p>The effect of the top cuts was reviewed with respect to the resulting Population distribution and fragmentation, mean and CV values.</p> <p>The model was validated by comparing statistics of the estimated blocks against the composited sample data; visual examination of the block grades versus assay data in section; swathe plots; and reconciliation against previous production and estimates.</p>                                                                                                                                                                                                                                                            |
| <b>Moisture</b>                                                                                                                                       | Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | All estimations are carried out on a 'dry' basis.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Cut-off parameters</b>                                                                                                                             | The basis of the adopted cut-off grade(s) or quality parameters applied.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | The indicative cut-off grade of 0.7 g/t Au for the Mineral Resource estimation is determined by the assumption that mining Trump will be a small to mid-sized open pit operation, mined as a satellite pit to Myhree. Material below base of pit RL (315mRL) has been reported at 2.0 g/t Au under the assumption of underground mining operations.                                                                                                                                                                                                                                                                                                                        |
| <b>Mining factors or assumptions</b>                                                                                                                  | Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.                                                                                                                           | <p>No minimum width is applied to the Resource. Minimum widths are assessed and applied using Whittle or Mining Shape Optimiser software during the Reserve process.</p> <p>It is assumed that planned dilution is factored into the process at the stage of Reserve and stope design planning.</p> <p>The open pit depth is applied to all material above the base of the \$AUD2,500 pit shell optimised with current industry rates for a satellite operation.</p>                                                                                                                                                                                                       |
| <b>Metallurgical factors or assumptions</b>                                                                                                           | The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.                                                                                                                                                       | <p>Assumed the material will be trucked and processed at Black Cat's own mill. Recovery factors are assigned based on lab test work, and on-going experience.</p> <p>No metallurgical assumptions have been built or applied to the Resource model.</p>                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Environmental factors or assumptions</b>                                                                                                           | Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made. | <p>A conventional storage facility is used for the process plant tailings.</p> <p>Waste rock is to be stored in a traditional waste rock landform 'waste dump'.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Bulk density</b>                                                                                                                                   | <p>Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the measurements, the nature, size and representativeness of the samples.</p> <p>The bulk density for bulk material must have been measured by methods that adequately account for void spaces (vugs, porosity, etc), moisture and differences between rock and alteration zones within the deposit.</p> <p>Discuss assumptions for bulk density estimates used in the evaluation process of the different materials.</p>                                                                                                  | <p>Bulk density is assigned based on regolith. Values of 1.80, 2.20 and 2.80 t/m<sup>3</sup> are used for oxide, transitional and fresh waste rock respectively.</p> <p>Bulk density values are taken from Myhree where more extensive density work has been completed. Density readings were taken from samples that were calculated using the Archimedes (water immersion) technique from drill core. Similar geological deposits in the Bulong geological area were also considered. A truncated average (extreme values removed) was calculated to determine density values that would apply.</p> <p>Density values are allocated uniformly to each regolith type.</p> |
| <b>Classification</b>                                                                                                                                 | <p>The basis for the classification of the Mineral Resources into varying confidence categories.</p> <p>Whether appropriate account has been taken of all relevant factors (ie relative confidence in tonnage/grade estimations, reliability of input data, confidence</p>                                                                                                                                                                                                                                                                                                                                                                                                   | <p>No Measured mineral resources at Trump.</p> <p>Indicated Mineral Resources is where drill spacing is typically around 25m x 25m in the south. While an area in North Trump is also drilled to this level, the relatively narrow nature of high-grade in the area means that 25m x 25m is not considered sufficient for</p>                                                                                                                                                                                                                                                                                                                                              |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                                                       | <p>Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1m samples from which 3kg was pulverised to produce a 30g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems.</p> <p>Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.</p> | <p>Black Cat's reverse circulation drilling is sampled into 1m intervals via a cone splitter on the rig producing a representative sample of approximately 3kgs. Samples are selected to weigh less than 3kg to ensure total sample inclusion at the pulverisation stage. Diamond samples are cut into half in prospective areas, with half core going to the laboratory and half core remaining with the library.</p> <p>Historical drilling and sampling are assumed as industry standard quality.</p> <p>All samples are crushed, dried and pulverised to a nominal 90% passing 75µm to produce a 40g or 50g sub sample for analysis by FA/AAS.</p> <p>Historical assays are assumed as industry standard.</p> |
| <b>Drilling techniques</b>                            | Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).                                                                                                                                                                                                                                                                                            | <p>RC drilling was completed using a face sampling percussion hammer. The reverse circulation bit size was 123mm to 143mm diameter. Diamond drilling was HQ for geotech holes, otherwise NQ.</p> <p>Historical reverse circulation drilling size is unknown.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Drill sample recovery</b>                          | Method of recording and assessing core and chip sample recoveries and results assessed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | RC samples are checked both visually and by hand-scales in the field. Recoveries for recent reverse circulation drilling have been recorded based on laboratory weights. It is unknown if historic recoveries were recorded. Diamond recoveries are measured using standard Rock Quality Designation ("RQD") measurements. Historic reverse circulation is unknown.                                                                                                                                                                                                                                                                                                                                               |
|                                                       | Measures taken to maximise sample recovery and ensure representative nature of the samples.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Sample recovery and representivity were maintained through industry standard maintenance of the cone splitter and verified through the use of duplicate samples. Diamond drilling utilised HQ3 drilling through zones of poor recovery. Historic reverse circulation is unknown.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                                                       | Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.                                                                                                                                                                                                                                                                                                                                                                                                               | Any historical relationship is not known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Logging</b>                                        | Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.                                                                                                                                                                                                                                                                                                                                                                              | Logging of reverse circulation chips and diamond core record lithology, mineralogy, texture, mineralisation, weathering, colour, alteration, veining and structure.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|                                                       | Whether logging is qualitative or quantitative in nature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Chips from all Black Cat's reverse circulation holes are stored in chip trays and photographed for future reference. These chip trays are archived in Kalgoorlie. Black Cat diamond core is located in a core yard east of Kalgoorlie.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                                                       | Core (or costean, channel, etc) photography.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | No historic core or chips are available.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

|                                                         | For geophysical tools, spectrometers, handheld XRF instruments, etc, the parameters used in determining the analysis including instrument make and model, reading times, calibrations factors applied and their derivation, etc. | A hand-held magnetic susceptibility metre was used on all diamond core drilled by Black Cat, at a rate of 1 reading per metre.                                                                                                                                                                                                                                                                                                                                                                                            |
|                                                         | Nature of quality control procedures adopted (eg standards, blanks, duplicates, external laboratory checks) and whether acceptable levels of accuracy (ie lack of bias) and precision have been established.                     | Black Cat drilling adhered to strict QAQC protocols involving weighing of samples, collection of field duplicates and insertion of certified reference material (blanks and standards). QAQC data are checked against reference limits in the SQL database on import.<br><br>The laboratory performs a number of internal processes including repeats, standards and blanks. Analysis of this data displayed acceptable precision and accuracy. Historic QAQC procedures are unknown but assumed to be industry standard. |
|                                                         | The verification of significant intersections by either independent or alternative company personnel.                                                                                                                            | Black Cat's significant intercepts are verified by database, geological and corporate staff.                                                                                                                                                                                                                                                                                                                                                                                                                              |
|                                                         | The use of twinned holes.                                                                                                                                                                                                        | Black Cat will use twinned holes to assist in verification of historic results from time to time.                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Verification of sampling and assaying                   | Documentation of primary data, data entry procedures, data verification, data storage (physical and electronic) protocols.                                                                                                       | All primary data related to logging is directly entered to Excel templates and sampling data is captured on paper logs first prior to digital entry. All paper copies of data have been stored. All data is sent to Perth and stored in the centralised Access database with an SQL backend, managed by a database consultant. Historic workflows are unknown.                                                                                                                                                            |
|                                                         | Discuss any adjustment to assay data.                                                                                                                                                                                            | No adjustments or calibrations are made to any assay data, apart from resetting below detection values to half positive detection. First gold assay is utilised for exploration work.                                                                                                                                                                                                                                                                                                                                     |
|                                                         | Accuracy and quality of surveys used to locate drill holes (collar and down-hole surveys), trenches, mine workings and other locations used in Mineral Resource estimation.                                                      | All Black Cat holes have been picked up by a licensed surveyor using RTK-GPS. Historic pickup methods are unknown.<br><br>Down hole surveys for Black Cat Drilling are collected a north seeking gyro.                                                                                                                                                                                                                                                                                                                    |
|                                                         | Specification of the grid system used.                                                                                                                                                                                           | Black Cat uses the grid system GDA 1994 MGA Zone 51. Previous data in grid systems AGD 1966 AMG Zone 51 and AGD 1984 AMG Zone 51 have been converted to MGA 94 Zone 51.                                                                                                                                                                                                                                                                                                                                                   |
| Location of data points                                 | Quality and adequacy of topographic control.                                                                                                                                                                                     | RLs have been assigned using the Shuttle Radar Topography Mission ("SRTM") digital elevation model, unless surveyed by RTK-GPS. RTK GPS pickups will be used to build up local topographic models over exploration areas.                                                                                                                                                                                                                                                                                                 |
|                                                         | Data spacing for reporting of Exploration Results.                                                                                                                                                                               | The nominal drill hole spacing is 30m (northing) by 20m (easting).                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Data spacing and distribution                           | Whether the data spacing and distribution is sufficient to establish the degree of geological and grade continuity appropriate for the Mineral Resource and Ore Reserve estimation procedure(s) and classifications applied.     | Drill hole spacing and distribution are sufficient to establish grade continuity appropriate for Mineral Resource estimation and classification.                                                                                                                                                                                                                                                                                                                                                                          |
|                                                         | Whether sample compositing has been applied.                                                                                                                                                                                     | The drill hole data has been composited downhole prior to the geostatistical analysis, continuity modelling and grade estimation process. A 1m sample was used which comprises over 99% of the raw sample lengths, in order to minimise any bias due to inconsistent sample lengths.                                                                                                                                                                                                                                      |
| Orientation of data in relation to geological structure | Whether the orientation of sampling achieves unbiased sampling of possible structures and the extent to which this is known, considering the deposit type.                                                                       | The deposit is drilled towards grid east at -60 to intersect the mineralised zones at a close to perpendicular relationship for the bulk of the deposit.                                                                                                                                                                                                                                                                                                                                                                  |
|                                                         | If the relationship between the drilling orientation and the orientation of key mineralised structures is considered to have introduced a sampling bias, this should be assessed and reported if material.                       | All drilling from surface has been drilled as close to perpendicular to the predicted orientation of stratigraphy as possible. This has reduced the risk of introducing a sampling bias as far as possible. No orientation-based sampling bias has been identified in the data at this point.                                                                                                                                                                                                                             |
| Sample security                                         | The measures taken to ensure sample security.                                                                                                                                                                                    | Black Cat's samples prepared on site by Black Cat geological staff. Samples are selected, collected into tied calico bags and delivered to the laboratory by staff or contractors directly and there are no concerns with sample security.                                                                                                                                                                                                                                                                                |
| Audits or reviews                                       | The results of any audits or reviews of sampling techniques and data.                                                                                                                                                            | Black Cat has appropriate sampling procedures.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Annual Mineral Resource and Ore Reserve Statement

| Section 2: Reporting of Exploration Results (Criteria listed in the preceding section also apply to this section.) |                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Between the closure of the Queen Margaret Mine (~1913) and 1970 very little occurred with only three diamond holes drilled in the area by Paringa in the 1940s. Activities in the 1970s and 1980s mainly focused on assessment of old workings along the Queen Margaret-Melbourne line. Queen Margaret NL, which floated in 1980 and was subsequently taken over by Spargo's Mining NL ("Spargo's"), drilled a number of diamond and reverse circulation holes into the main lode, with a view to reopening the historic Queen Margaret Mine. Geology, assays and collar files are recorded, but the core is no longer available. Spargo's farmed out to Mount Monger Gold Project ("MMGP") (a Joint Venture of General Gold and Ramsgate Resources) who drilled a further 165 reverse circulation holes into the Queen Margaret system. No resources were publicly identified. Queen Margaret was never reopened, and attention turned to wider exploration in the Bulong area.</p> <p>Boundary was reputedly discovered by MMGP in 1991 by a BLEG program. About 73 reverse circulation holes have been drilled into the Boundary deposit, initially by General Gold in 1992, then Acacia Resources in 1996, and Yilgarn Gold in the early 2000s.</p> <p>General Gold completed air core drilling over the immediate area of Myhree in 1992. RAB drilling extending this line and on additional lines further north were completed by Acacia Resources in 1999. Four shallow reverse circulation holes (TE1-TE4) were drilled by Bulong Mining Pty Ltd to follow up anomalous results in the air core drilling and no further exploration is recorded.</p> <p>There has been no prior diamond drilling at either prospect.</p> <p>Around 1996, Acacia Resources sought to consolidate, by way of farm-in and acquisition, much of the land holdings in Bulong Belt. Acacia Resources was the manager of the New Bulong and Queen Margaret Joint Ventures. Acacia Resources was taken over by Anglo Gold who undertook much more soil geochemistry and did systematic transect drilling across known prospects and into greenfield areas. Anglo Gold consolidated the soil and drill-hole datasets. After the identification of a string of gold deposits which did not meet their corporate objective of plus-million-ounce target, Anglo Gold tendered out their rights to the tenements and the database to ASX listed Yilgarn Gold in 2002.</p> <p>Yilgarn Gold's strategic objective was to develop high-grade, narrow-vein underground mining opportunities. It further consolidated its land holding by acquiring properties of Central Kalgoorlie Gold Mines. In 2005, Yilgarn Gold completely changed its corporate focus to off-shore energy, disposed of its mineral assets, and changed its name to Kairiki Energy.</p> <p>A local prospecting syndicate (Bulong Mining Pty Ltd) secured an option in 2009 and in 2012 fully acquired the properties and the database. Bulong Mining Pty Ltd undertook serious metal detecting and limited RAB/RC drilling until early 2018 when the tenements were acquired by Black Cat.</p> |
| Geology                                                                                                            | Deposit type, geological setting and style of mineralisation.                                                                                                                                                                                                                | The Bulong Gold Project is located in the Gindalbie Domain of the Kurnalpi Terrane of the Archaean Yilgarn Craton. Project-scale geology consists of granite-greenstone lithologies that were metamorphosed to greenschist facies grade. The Archaean                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Annual Mineral Resource and Ore Reserve Statement

| Section 2: Reporting of Exploration Results (Criteria listed in the preceding section also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                                          |

| <b>Database integrity</b>                                                                                                                             | <p>Measures taken to ensure that data has not been corrupted by, for example, transcription or keying errors, between its initial collection and its use for Mineral Resource estimation purposes.</p> <p>Data validation procedures used.</p>                                                                                                                                                                            | <p>Black Cat geological data is stored in SQL server databases. The SQL databases are hosted centrally and managed by Black Cat personnel. User access to the database is regulated by specific user permissions and validation checks to ensure data is valid. Acquire software has been implemented as a front-end interface to manage the geological database.</p> <p>Existing protocols maximize data functionality and quality whilst minimizing the likelihood of error introduction at primary data collection points and subsequent database upload, storage and retrieval points. Data templates with lookup tables and fixed formatting have been used for collecting primary data on field laptops. The software has validation routines and data is subsequently imported into a secure central database.</p> <p>The SQL server database is configured for validation through parent/child table relationships, required fields, logical constraints and referenced library tables. Data that fails these rules on import is rejected or quarantined until it is corrected.</p> <p>The SQL server database is managed by a contract Database Manager who is responsible for all aspects of data entry, validation, development, quality control and specialist queries. There is a standard suite of validation checks for all data.</p>                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Site visits</b>                                                                                                                                    | <p>Comment on any site visits undertaken by the Competent Person and the outcome of those visits.</p> <p>If no site visits have been undertaken indicate why this is the case.</p>                                                                                                                                                                                                                                        | The Competent Person has undertaken a visit to site prior to the completion of the model in 2019. No drilling activities were taking place. However, the Competent Person was able to view a number of drill holes reverse circulation chips and was able to visit some of the costeans previously excavated to gain firsthand knowledge of the geological stratigraphy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Geological interpretation</b>                                                                                                                      | <p>Confidence in (or conversely, the uncertainty of) the geological interpretation of the mineral deposit.</p> <p>Nature of the data used and of any assumptions made.</p> <p>The effect, if any, of alternative interpretations on Mineral Resource estimation.</p> <p>The use of geology in guiding and controlling Mineral Resource estimation.</p> <p>The factors affecting continuity both of grade and geology.</p> | <p>The Resource categories assigned to the model directly reflect the confidence of the geological interpretation that is built using local, structural, mineral, and alteration geology obtained from geophysics, logging, drilling results and mapping.</p> <p>The geological interpretation of Queen Margaret and Melbourne United has considered all available geological information. Rock types, mineral, alteration and veining from both reverse circulation chips and diamond core were all used to define the mineralised domains and regolith surfaces. Interpreted shears and faults were obtained from pit mapping and diamond core logging to further constrain the domaining.</p> <p>The geological wireframes defining the mineralised zones are considered robust. Alternative interpretations were earlier trial interpretations that do not affect the current Mineral Resource estimation.</p> <p>The wireframed domains are used as hard boundaries during the Mineral Resource estimation. They are constructed using all available geological information (as stated above) and terminate along known structures. Mineralisation styles, geological distinctiveness and grade distributions (used to assess any potential populations mixing) are all assessed to ensure effective and accurate estimation of the domains.</p> <p>Mineralisation is present in three main zones within the porphyry; the hanging wall contact (historically mined to 240m), the footwall contact, and the flatter lying, south dipping quartz veins within the porphyry. The deposit has had a complex structural history, and the presence of NW and NE fault zones are apparent and influence mineralisation.</p> |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |       |      |        |            |           |            |                     |           |   |

| <b>Estimation and modelling techniques</b>                                                                                                            | <p>The nature and appropriateness of the estimation technique(s) applied and key assumptions, including treatment of extreme grade values, domaining, interpolation parameters and maximum distance of extrapolation from data points. If a computer assisted estimation method was chosen include a description of computer software and parameters used.</p> <p>The availability of check estimates, previous estimates and/or mine production records and whether the Mineral Resource estimate takes appropriate account of such data.</p> <p>The assumptions made regarding recovery of by-products.</p> <p>Estimation of deleterious elements or other non-grade variables of economic significance (eg sulphur for acid mine drainage characterisation).</p> <p>In the case of block model interpolation, the block size in relation to the average sample spacing and the search employed.</p> <p>Any assumptions behind modelling of selective mining units.</p> <p>Any assumptions about correlation between variables.</p> <p>Description of how the geological interpretation was used to control the resource estimates.</p> <p>Discussion of basis for using or not using grade cutting or capping.</p> <p>The process of validation, the checking process used, the comparison of model data to drill hole data, and use of reconciliation data if available.</p> | <p>Gold grade was estimated using ordinary kriging. It was considered that a more robust geological model with smoother and more continuous mineralised lodes will reduce the effects of higher CV. Estimation was carried out on the parent cell.</p> <p>Variograms were generated using composited drill data in Snowden Supervisor v8 software.</p> <p>Search ellipse dimensions and orientation reflect the parameters derived from the variography analysis and the Kriging Neighbourhood Analysis.</p> <p>No other elements were estimated.</p> <p>No deleterious elements were estimated or assumed.</p> <p>Block sizes were selected based on drill spacing and the thickness of the mineralised veins.</p> <p>Average drill spacing was 50m x 50m in the majority of the deposit, and down to 20m x 20m grade control in existing pit, with backs samples on the underground development approximately 3m apart. Block sizes were 5m x 10m x 5m with a sub-celling of down to 0.5m x 1.25m x 1.25m to more accurately reflect the volumes of the interpreted wireframes.</p> <p>No selective mining units were assumed in the Resource estimate.</p> <p>Only Au grade was estimated.</p> <p>Blocks were generated within the mineralised surfaces the defined each mineralised zone. Blocks within these zones were estimated using data that was contained with the same zone. Hard boundaries were used for all domains.</p> <p>Top cuts were applied to the data to control the effects of extreme high-grade Au values that were considered not representative. The effect of the top cuts were reviewed with respect to the resulting population distribution and fragmentation, mean and CV values.</p> <p>The model was validated by comparing statistics of the estimated blocks against the composited sample data; visual examination of the block grades versus assay data in section; swathe plots; and reconciliation against previous production.</p> <p>All estimations are carried out on a 'dry' basis.</p> |       |      |        |            |           |            |                     |           |   |
| <b>Moisture</b>                                                                                                                                       | Whether the tonnages are estimated on a dry basis or with natural moisture, and the method of determination of the moisture content.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |       |      |        |            |           |            |                     |           |   |

Material outside and below base of pit RL has been reported at 2.0 g/t Au under the assumption of the underground mining operations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |       |      |        |            |           |            |                     |           |   |
| <b>Mining factors or assumptions</b>                                                                                                                  | Assumptions made regarding possible mining methods, minimum mining dimensions and internal (or, if applicable, external) mining dilution. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential mining methods, but the assumptions made regarding mining methods and parameters when estimating Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the mining assumptions made.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>No minimum width is applied to the resource. Minimum widths are assessed and applied using Whittle and Mining Shape Optimiser software during the reserve process.</p> <p>It is assumed that planned dilution is factored into the process at the stage of reserve and stope design planning.</p> <p>For the assumption of reasonable prospect of mining the following parameters have been selected for the generation of an optimisation shell to determine reporting RL depths:</p> <table border="1"> <thead> <tr> <th>Price</th><th>Unit</th><th>Amount</th></tr> </thead> <tbody> <tr> <td>Gold Price</td><td>AUD/ounce</td><td>\$1,800.00</td></tr> <tr> <td>Aboriginal Heritage</td><td>AUD/ounce</td><td>-</td></tr> </tbody> </table>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Price | Unit | Amount | Gold Price | AUD/ounce | \$1,800.00 | Aboriginal Heritage | AUD/ounce | - |

| <b>Metallurgical factors or assumptions</b>                                                                                                           | The basis for assumptions or predictions regarding metallurgical amenability. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider potential metallurgical methods, but the assumptions regarding metallurgical treatment processes and parameters made when reporting Mineral Resources may not always be rigorous. Where this is the case, this should be reported with an explanation of the basis of the metallurgical assumptions made.                                                                                                                                                       | Assumed the material will be trucked and processed at a toll treat gold plant. Recovery factors are assigned based on laboratory test work, and on-going experience.<br><br>No metallurgical assumptions have been built or applied to the Resource model.                                                                                                                                               |                  |                |
| <b>Environmental factors or assumptions</b>                                                                                                           | Assumptions made regarding possible waste and process residue disposal options. It is always necessary as part of the process of determining reasonable prospects for eventual economic extraction to consider the potential environmental impacts of the mining and processing operation. While at this stage the determination of potential environmental impacts, particularly for a greenfields project, may not always be well advanced, the status of early consideration of these potential environmental impacts should be reported. Where these aspects have not been considered this should be reported with an explanation of the environmental assumptions made. | A conventional storage facility is used for the process plant tailings.<br><br>Waste rock is to be stored in a traditional waste rock landform 'waste dump'. Due to moderate to high sulphide content and the minimal presence of carbonate alteration, the potential for acid content is considered high. A waste rock control strategy is planned to be put in place at the time of any future mining. |                  |                |
| <b>Bulk density</b>                                                                                                                                   | Whether assumed or determined. If assumed, the basis for the assumptions. If determined, the method used, whether wet or dry, the frequency of the                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Bulk density is assigned based on regolith profile and geology. Values of 1.80, 2.10 and 2.79 t/m3 are used for oxide, transitional and fresh waste rock respectively.                                                                                                                                                                                                                                   |                  |                |

## Annual Mineral Resource and Ore Reserve Statement

| Section 3: Estimation and Reporting of Mineral Resources (Criteria listed in section 1, and where relevant in section 2, also apply to this section.) |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

All samples are weighed in the laboratory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|                                                       | Aspects of the determination of mineralisation that are Material to the Public Report. In cases where 'industry standard' work has been done this would be relatively simple (eg 'reverse circulation drilling was used to obtain 1m samples from which 3kg was pulverised to produce a 30g charge for fire assay'). In other cases more explanation may be required, such as where there is coarse gold that has inherent sampling problems. | Historical drilling and sampling is assumed as industry standard quality. This has been checked via database audits and drilling.<br>Black Cat's reverse circulation drilling is sampled into 1m intervals via a cone splitter on the rig producing a representative sample of approximately 3kgs. Samples are selected to weigh less than 3kg to ensure total sample inclusion at the pulverisation stage.                                                                                                                                                                                                                                                                              |
|                                                       | Unusual commodities or mineralisation types (eg submarine nodules) may warrant disclosure of detailed information.                                                                                                                                                                                                                                                                                                                            | Black Cat's diamond drilling is sampled based off lithological contacts to a maximum sample length of 1m. Core is cut and quarter core samples taken in a consistent manner always taking the same portion of core to the right of the orientation line looking downhole.<br>Historical drilling and sampling are assumed as industry standard quality, with historic reports indicating similar processes to those undertaken by Black Cat.<br>All samples are crushed, dried and pulverised to a nominal 90% passing 75µm to produce a 40g or 50g sub sample for analysis by FA/AAS.<br>Historical assays were completed by Genalysis Kalgoorlie and are assumed as industry standard. |
| <b>Drilling techniques</b>                            | Drill type (eg core, reverse circulation, open-hole hammer, rotary air blast, auger, Bangka, sonic, etc) and details (eg core diameter, triple or standard tube, depth of diamond tails, face-sampling bit or other type, whether core is oriented and if so, by what method, etc).                                                                                                                                                           | Reverse circulation drilling was completed using a face sampling percussion hammer. The reverse circulation bit size was 123mm to 143mm diameter.<br>Diamond drilling was completed using HQ size.<br>Historical reverse circulation drilling size is unknown.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Drill sample recovery</b>                          | Method of recording and assessing core and chip sample recoveries and results assessed.                                                                                                                                                                                                                                                                                                                                                       | Reverse circulation samples are checked both visually and by hand-scales in the field. Recoveries for recent reverse circulation drilling have been recorded based on laboratory weights. It is unknown if historic recoveries were recorded. Historic reverse circulation is unknown.<br>Diamond core is geologically and geotechnically logged with core loss noted during this process.                                                                                                                                                                                                                                                                                               |
|                                                       | Measures taken to maximise sample recovery and ensure representative nature of the samples.                                                                                                                                                                                                                                                                                                                                                   | Sample recovery and representivity were maintained through industry standard maintenance of the cone splitter and verified through the use of duplicate samples. Historic reverse circulation is unknown.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|                                                       | Whether a relationship exists between sample recovery and grade and whether sample bias may have occurred due to preferential loss/gain of fine/coarse material.                                                                                                                                                                                                                                                                              | There is no known relationship between sample recovery and grade for drilling completed by Black Cat. Any historical relationship is not known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Logging</b>                                        | Whether core and chip samples have been geologically and geotechnically logged to a level of detail to support appropriate Mineral Resource estimation, mining studies and metallurgical studies.                                                                                                                                                                                                                                             | Logging of reverse circulation chips record lithology, mineralogy, texture, mineralisation, weathering, colour, alteration, veining and structure.<br>Diamond core has been geologically logged and sampled by Black Cat geologists for lithology, mineralogy, texture, mineralisation, weathering, colour, alteration, veining and structure. Drill core has also been geotechnically logged by geotechnical consultants contracted to conduct geotechnical studies to support mining studies.                                                                                                                                                                                          |
